

Changes Made Since 9/12/13

- (1) If Oil or Combo well with freshwater casing only and water level is not accessible, do not need to provide surface casing set depth.
- (2) Moved reset function to column BX.
- (3) Added warning to remind user to select the "Customize Data Tables" button before proceeding.
- (4) Added new section under 4a. Well Type – 4b. Well Construction Information Not Readily Available – this section is for operators who are unable to locate a well record for one of their wells, or unable to enter well construction information during the first year (2013) of the program.
- (5) Added macro button "Set Up Well for First Inspection" that establishes minimal inspection components when well construction details are not readily available – expectation is that additional details regarding the well construction will be collected in 2014, if possible, during the course of routine inspections and that the well construction details will be updated by the 2015 reporting deadline.
- (6) Removed automatic input of "Y" from Annular Production Column when "Combo" is selected because some wells produce oil and gas through the primary production string. Have coding in place to block out primary production pressure if gas is produced via the annulus and "Combo" well is selected. Default coding set to keep both annular production and primary production available.
- (7) Added validation cell ("Y") prior to transferring data from fourth quarter of the previous year.
- (8) Allow for submittal of average daily pumping volume in bbls as opposed to average daily pumping time, when this item is needed as a substitute for the water level.
- (9) Changed coding for "shut-in," "venting," and "inaccessible" production annular space status information due to 4th quarter error when first quarter is populated with a date.
