

**Transcontinental Gas Pipe Line Company, LLC**

**Requirement G-2 – Threatened and Endangered Species  
Coordination Summary**

**Regional Energy Access Expansion Project –  
Regional Energy Lateral and Existing Compressor Station 515**

**April 2021**

**THREATENED AND ENDANGERED SPECIES COORDINATION SUMMARY**

This section discusses the presence of federally- and state-listed rare plant and animal species potentially occurring within or near the Project area. Coordination has been initiated with the Pennsylvania Department of Conservation and Natural Resources (DCNR), Pennsylvania Fish and Boat Commission (PFBC), Pennsylvania Game Commission (PGC), and the United States Fish and Wildlife Service (USFWS). Agency coordination resulted in the identification of several species that may occur within the Project area and are provided below in Table G-2.1. A concurrent review with the reviewing agencies is being conducted in conjunction with the Chapter 102 and 105 Permit Review Process.

Requirement G-2 – Threatened and Endangered Species Coordination Summary*

**Table G.2-1  
Federally- and State-Listed Species Potentially Occurring Within the Project Area**

<b>Species Group</b>	<b>Species Common Name</b>	<b>Scientific Name</b>	<b>Federal Status</b>	<b>State Status<sup>a</sup></b>	<b>Project Components with Potential Occurrence</b>	<b>County of Potential Occurrence within Project Area<sup>b</sup></b>	<b>Planned Survey Timeframe</b>	<b>Survey Status</b>
	Lupine	<i>Lupinus perennis</i>	Not listed	Rare	Regional Energy Lateral	Luzerne County, PA (Plains Township)	July	Complete; with exception of one survey area

Sources: USFWS (Jahrsdoerfer 2020), PFBC (Lech 2020), PADCNr (Podnieszinski 2020), PGC (Braun 2020)

<sup>a</sup> Current status listed for PA – see column titled “County/State of Potential Occurrence within Project Area” for locations of possible occurrence.

<sup>b</sup> Based on federal and state resource agency feedback.

<sup>c</sup> Crossing at the Susquehanna River will be conducted via trenchless crossing methods. Field surveys are not necessary for molluscs when trenchless crossings are used and are not required for water withdrawal activities.

<sup>d</sup> The USFWS approved presence/absence bat survey method for the 2019-2020 season was acoustic surveys. Pending surveys to be completed in 2021 will adhere to the latest approved USFWS survey methods.

## **USFWS Coordination**

### **Indiana Bat**

The USFWS PA Field Office indicated the Project facilities in PA are within the range of the Indiana bat (*Myotis sodalis*), which is federally listed as endangered. In order to determine whether the Project will affect potential habitat for this species, the USFWS requested summer presence/absence surveys and winter habitat surveys to be conducted.

To minimize direct human contact with bats, PGC has imposed a temporary moratorium on the 2019-2020 bat mist net survey season to minimize potential disease transmission to bat populations. In lieu of mist net surveys, Transco conducted acoustic surveys during summer 2020 for bats for the pipelines and aboveground facilities in PA where forest clearing is required. Pending surveys on one access road are expected to be completed during the 2021 survey window. Acoustic surveys involve placing detectors to record bat calls within suitable summer habitat. The acoustic samples are then analyzed using USFWS-approved acoustic bat identification software. A report was submitted to the USFWS and PGC on November 25, 2020.

A Phase I hibernacula search was conducted to identify potential hibernacula within 0.5 mile of the Regional Energy Lateral component of the Project between MPs 8.0 and 17.5 in Luzerne County, PA. A desktop analysis indicated that portions of the Regional Energy Lateral are located within areas that were previously mined. As a result, ground assessments were conducted throughout 2020. A total of 56 potential hibernacula were found within the survey area. Transco conducted acoustic sampling at 28 of these potential hibernacula in fall 2020. The acoustic surveys determined probable presence for the federally and state endangered Indiana bat (*Myotis sodalis*) at one location. The remaining 28 are tentatively proposed for survey in 2021. The areas that were not surveyed in fall 2020 due to the landowner access becoming available late in the fall survey window. A report with the 2020 fall acoustic results was submitted on February 25, 2021. Additionally, a report with locations and photos of the additional 28 potential hibernacula was also submitted.

As part of continued coordination with the USFWS, Transco is reviewing the results of the surveys with the agencies to determine the appropriate mitigation measures and time of year restrictions.

**Northern Long-eared Bat**

As noted in the USFWS PA Field Office correspondence dated May 12, 2020, the entire proposed Project in PA is located within the range of the federally threatened and state endangered northern long-eared bat (*Myotis septentrionalis*). Summer acoustic surveys determined the probable presence of the northern long-eared bat at three survey sites associated with the Regional Energy Lateral. Reports were submitted to the USFWS on November 25, 2020 outlining the results of the 2020 Summer Acoustic Surveys. Fall acoustic surveys indicated a probable presence at three locations. On February 25, 2021, a report was submitted to the USFWS outlining the results of the 2020 Fall Bat Acoustic Phase 2 Hibernacula Survey completed for the Regional Energy Lateral.

As part of continued coordination with the USFWS, Transco is reviewing the results of the surveys with the agencies to determine the appropriate mitigation measures and time of year restrictions.

**Northeast Bulrush**

Project components in PA are within the range of the northeastern bulrush (*Scirpus ancistrochaetus*), which is federally-listed as endangered (Jahrsdoerfer 2020). In order to conserve northeastern bulrush (if present), the USFWS PA Field Office recommended a 300-foot-wide upland buffer around wetlands, as well as 50- to 100-foot-wide buffers along waterways to filter pollutants and stabilize streambanks. If buffers are included, the USFWS PA Field Office states the proposed Project is not likely to adversely affect the northeastern bulrush (Jahrsdoerfer 2020). If this buffer could not be adopted, the USFWS requested a survey of potentially suitable wetland habitat for the presence of this species.

Surveys for northeastern bulrush were completed during the flowering/fruiting season between June and September 2020. The species was not found within the Project limits. A Northeastern Bulrush Survey Report has been submitted to the USFWS on November 25, 2020 and is under review.

**Bog Turtle**

Consultation with the United States Fish and Wildlife Service regarding Bog Turtle's is outlined in Requirement G. The USFWS PA Field Office did not identify sections of the regional Energy Lateral component of the Project located in Luzerne County as being within the known range for the bog turtle (*Clemmy muhlenbergii*).

Transco is proposing wetland mitigation at an off-site location in Northampton County. The PNDI review indicated a potential occurrence of the bog turtle. A Phase 1 Survey was completed at the site in September 2020, and it was determined that potentially suitable bog turtle habitat is present. A Phase 2 Survey is proposed in the spring of 2021.

**DCNR Coordination**

**State-Listed Plant Species**

The DCNR identified several target plant species within the counties crossed by the pipeline facilities (see Table 2.2-1). Target species include those that are state-listed or proposed for state listing as rare, threatened, or endangered. The PADCNR indicated these species were documented in or near the proposed ROW, and they requested plant surveys be conducted for these target species in the Project area (Podniesinski 2020, Podniesinski 2020b). Survey windows vary for each species based primarily on flowering times, or other times of year when the plant is most readily apparent. Table 2.2-2 describes suitable habitat and flowering windows for each of the seven state-listed plant species. The federally-listed northeastern bulrush is previously described under the USFWS Coordination section.

**Table 2.2-2  
 Habitat and Flowering Windows for State-Listed Plant Species Potentially Occurring Within the Project Area**

<b>Common Name</b>	<b>Scientific Name</b>	<b>Habitat</b>	<b>Flowering Window</b>
Lupine	<i>Lupinus perennis</i>	Alluvial sand and gravel bars, open fields, wood edges and roadsides in sandy soils	April-July
Soft-leaved Sedge	<i>Carex disperma</i>	Swampy woods, bogs, and rhododendron swamp	May-August (Fruit)
Sources: Podniesinski 2020			

Field surveys for Soft-leaved Sedge are complete throughout the Project area with no target species identified. Field surveys for Lupine (*Lupinus perennis*) are complete throughout the Project areas with the exception of MPs 8.3 to 9.9 on the Regional Energy Lateral. Surveys also identified one plant that was not on the DCNR PNDI response: purple bedstraw (*Galium latifolium*). A Botanical Survey Report was submitted to the DCNR on November 25, 2020 and is currently under review. Field surveys for Lupine from MPs 8.3 to 9.9 are scheduled for spring of 2021.

## **PFBC Coordination**

### **Timber Rattlesnake**

According to correspondence with the PFBC, the portion of the Regional Energy Lateral east of I-476 is in close proximity to known critical timber rattlesnake (*Crotalus horridus*) habitat (Lech 2020b). The PFBC requested Transco complete a habitat assessment to be conducted in the portions of the Regional Energy Lateral located East of I-476. During follow up email correspondence, the study area refined to approximately milepost 6.5 and 9.0 (I-476) (Lech 2020c).

Transco completed Phase I habitat assessment surveys in summer 2020 between approximately MP 6.5 and MP 9.0. Surveys were conducted within a survey corridor extending 300 feet of the LOD. Potential denning and gestational habitat were identified in the study area during Phase I Habitat Assessment surveys. A Phase II presence/absence survey will be completed between April 15 and May 15, 2021 in habitat areas where potential denning habitat was identified. Transco proposes to re-construct rock habitat identified as gestation habitat during the Project construction restoration (Lech 2020e).

### **Mussels**

The PFBC has determined that three species of rare mussels are known from the vicinity of the Regional Energy Lateral Susquehanna River crossing and are likely to occur within the proposed Project area. The species include: Elktoe (*Alasmidonta marginata*), Green Floater (*Lasmigona subviridis*), and Triangle Floater (*Alasmidonta undulata*). The PFBC recommended mussel surveys to be completed in the areas that may be directly or indirectly affected by the proposed in-stream work that will take place within the Susquehanna River, unless the pipeline will be installed via horizontal directional drill (Lech 2020, Lech 2020b). Transco proposes to cross the Susquehanna River via a trenchless technique (Direct Pipe®) and therefore does not anticipate a need for mussel surveys. PFBC also confirmed that the small cable that may be laid in the streambed for surveying the location of the Direct Pipe® progress and that temporary water intake at the river crossing would not require mussel surveys. Instead, the PFBC recommended running a PNDI as part of the water withdrawal application, for which no impacts were found (Lech 2020c). Therefore, no impacts to protected mussels are anticipated as a result of this Project.

## **PGC Coordination**

### **Eastern Small-footed Bat**

The PGC has determined the Eastern small-footed bat (*Myotis leibii*), a threatened species in PA, is located within the vicinity of the Project. Therefore, the PGC recommended surveys to be conducted for areas associated with the Project located between MPs 8.0 and 17.5 of the Regional Energy Lateral portion located in Luzerne County, PA. Field surveys to be completed include: Summer Day Roost Habitat Assessment and Winter Hibernacula Habitat assessment (Braun 2020, Braun 2020b).

Transco completed an assessment of Eastern Small-Footed Bat summer habitat within 0.25 mile of the Regional Energy Lateral component of the Project between MPs 8.0 and 17.5 in Luzerne County, PA throughout 2020. A total of 14 sites containing potentially suitable day roost rocky habitat were documented. A report was submitted to the PGC on November 25, 2020 and a response is pending. Transco is planning to complete Presence/Absence Surveys to determine use of the day roost habitat in 2021.

A 2020 Summer Bat Acoustic Presence/Absence Survey Report was also submitted to the USFWS and PGC on November 25, 2020. The report outlined the probable presence of the eastern small-footed bat at 4 locations associated with the Regional Energy Lateral.

A Phase I hibernacula search was conducted to identify potential hibernacula within 0.5 mile of the Regional Energy Lateral component of the Project between MP 8.0 and 17.5 in Luzerne County, PA. A desktop analysis indicated that portions of the Regional Energy Lateral are located within areas that were previously mined. As a result, ground assessments were conducted throughout 2020. A total of 56 potential hibernacula were found within the survey area. Transco conducted acoustic sampling at 28 of these potential hibernacula in fall 2020 and determined the probable presence of the state-threatened eastern small-footed bat at 8 locations. The remaining 28 potential hibernacula are tentatively proposed for survey in 2021. The areas that were not surveyed in fall 2020 due to the landowner access becoming available late in the fall survey window. A report with the 2020 fall acoustic results was submitted on February 25, 2021. Additionally, a report with locations and photos of the additional 28 potential hibernacula was submitted.

A 2020 Summer Bat Acoustic Presence/Absence Survey Report was also submitted to the USFWS and PGC on November 25, 2020. The report outlined the probable presence of the eastern small-footed bat at 4 locations associated with the Regional Energy Lateral.

As part of continued coordination with the PGC, Transco is reviewing the results of the surveys with the agencies to determine the appropriate mitigation measures and time of year restrictions.

*Additional State-Listed Bat Species*

Though the autoclassifier used to conduct acoustic surveys has not been specifically approved for species other than federally listed species, the detectors determined the probable presence of two Pennsylvania state endangered bat species: little brown bat and tri-colored bat. During the 2020 Summer Bat Acoustic Surveys probable presence was detected for the little brown at 10 locations. Probable presence was also detected for the tri-colored bat at 2 locations. During 2020 Fall Bat Acoustic Phase 2 Hibernacula Surveys, the probable presence was detected for the little brown bat at 5 locations and the tri-colored bat at 2 locations.

As part of continued coordination with the PGC, Transco is reviewing the results of the surveys with the agencies to determine the appropriate mitigation measures and time of year restrictions.
