Undetained Areas: 0.90

0.90 acre(s)

The Project Qualifies as a Site Restoration Project (25 Pa. Code §102.8(n))

2. Describe the sequence of PCSM BMP implementation in relation to earth disturbance activities and a schedule of inspections for the critical stages of PCSM BMP installation.

The PCSM BMP Terre Arch subsurface infiltration beds will be constructed after the site grading has reached desired elevations. The PCSM BMP locations will be excavated to the proper depths and the arches installed. This critical stage of installation will be supervised by the products supplier, Terre Hill Company. The Water Quality Inlet insets cannot be installed in the completed stormwater collection system until the entire site has been permanently stabilized and the temporary inlet filter bag E&S BMP's are no longer needed and have been removed. A licensed professional will assure proper installation of these devices.

3.	Plan drawings have been developed for the project and will be available on-site.
4.	Plan drawings have been developed for the project and are attached to the NOI/application.
5.	Recycling and proper disposal of materials associated with PCSM BMPs are addressed as part of long-term operation and maintenance of the PCSM BMPs.
6.	lentify naturally occurring geologic formations or soil conditions that may have the potential to cause pollution after earth isturbance activities are completed and PCSM BMPs are operational and the applicant's plan to avoid or minimize otential pollution and its impacts.
	The site is underlain by Hamilton Group geology which is known to contain pyritic shale. The Geotechnical Engineering Report documents that testing revealed pyritic sulfur bedrock could be encountered in the area proposed for the underground fuel tanks. The Geotechnical engineer will be present during excavation to valuate soil conditions encountered in the field and determine the need for further testing. See Sheets ES4 and CSM 3 for more detailed recommendations.
7.	dentify whether the potential exists for thermal impacts to surface waters from post-construction stormwater. If such otential exists, identify BMPs that will be implemented to avoid, minimize, or mitigate potential thermal impacts.
	any time when vegetated surfaces are change to impervious surface, thermal impacts can result. Thermal npacts will be minimized by utilizing underground PCSM BMP's that will help to avoid solar warming of ponded vater.
8.	The PCSM Plan has been planned, designed, and will be implemented to be consistent with the E&S Plan.
9.	A pre-development site characterization has been performed.
