

FIELD LOG –

Weeks of June 24 and July 1

Continue to implement the 2013 PROPOSED
SUSQUEHANNA RIVER SAMPLING PLAN:

- *Two weeks of rain has caused high flow conditions on all major rivers throughout the state. The Susquehanna River is forecasted to crest above nine feet next week.*
- *The few non-wadable fish sites that have not been sampled will be rescheduled when flows decrease.*
- *Mid-summer periphyton (algae) sampling has been rescheduled for late July.*
- *Routine water quality transect data continues to be collected at established locations.*
