

Juniata Valley

TETRA TECH, INC.

By: RH Date: 11/18/2016 Subject: Juniata Valley Road
Checked By: JB Date: 11/23/2016 PCSM Design and Evaluation

PURPOSE:

The purpose of these calculations is to design a Post-Construction Stormwater Management (PCSM) Plan for the Juniata Valley Road block valve site as part of the Sunoco Pipeline L.P. Pennsylvania Pipeline Project. The site is located within Frankstown Township, Blair County, Pennsylvania. Permanent stormwater controls will be developed to satisfy PADEP and Frankstown Township's approved Act 167 Plan.

PCSM DESIGN REQUIREMENTS:

The PCSM design for this project follows the PA Department of Environmental Protection's (PADEP) Pennsylvania Stormwater Best Management Practices Manual (BMP Manual), December 2006; and the standard design criteria from PA Title 25, Chapter 102.8.(g)(2) and (3). The design criteria evaluated for the site are summarized below.

Act 167 Consistency

The Juniata Valley Road block valve site is located in Blair County, which does not have a county-wide Act 167 plan adopted. However, Frankstown Township has enacted the Beaverdam Branch Watershed Act 167 Stormwater Management Plan. This plan requires that the post-development runoff rate be less than or equal to the pre-development rate. The PCSM design at the Juniata Valley Road block valve has been designed for consistency with Frankstown Township's approved Act 167 Plan.

Recommended Volume Control Guideline

Use of Control Guideline 1 is recommended where site conditions offer the opportunity to reduce the increase in runoff volume as follows:

- Do not increase the post-development total runoff volume for all storms equal to or less than the two-year/24-hour event;
- Existing (pre-development) non-forested pervious areas must be considered meadow (good condition) or its equivalent; and
- 20 percent of existing impervious area, when present, shall be considered meadow (good condition) or its equivalent.

Due to the lack of surface infiltration rates at the Juniata Valley Road block valve site, it is not possible to infiltrate the 2-year/24-hour stormwater runoff volume increase. Volume reducing BMPs in the PADEP Stormwater BMP Manual were analyzed on a case-by-case basis but did not meet their respective requirements. As a result, a slow-release BMP has been proposed.

Recommended Peak Rate Control Guideline

The recommended control guideline for peak rate control is:

- Do not increase the peak rate of discharge for the 2-year through 100-year events (at minimum); as necessary, provide additional peak rate control as required by the applicable and approved Act 167 plan.
- The Frankstown Township Act 167 rate requirements mirror PADEP's requirements. Therefore, no additional peak rate control is required under the Act 167 Plan.

This site will utilize a slow release BMP to manage the two-year through 100-year peak rate increases. This BMP will also help to increase the time of concentration for the drainage area encompassing the block valve.

Recommended Water Quality Control Guideline

Control Guideline 1 will provide water quality control and stream channel protection as well as flood control protection. The use of a slow-release BMP has been approved by PADEP as an appropriate way to meet the requirements of Control Guideline 1 when onsite infiltration is not feasible.

Infiltration

Infiltration rates for the PCSM BMPs have been determined from site infiltration testing conducted in accordance of the PA BMP Manual. Documentation for infiltration testing and design infiltration rates can be found in Attachment 5 of the Site Restoration/Post Construction Stormwater Management Plan. Infiltration test locations and recommended design rates are also labeled on the PCSM Plan Drawings in Attachment 6.

During the onsite infiltration tests, the depth to seasonal high groundwater and shallow bedrock or another confining layer were evaluated. The post-construction stormwater management facility for the site has been designed to maintain 2 feet of separation between the ponding elevation of the facility and the seasonal high water table and bedrock.

The post-construction stormwater management design utilizes a slow-release BMP to manage runoff volume due to poorly infiltrating soils onsite.

Loading Ratio

The loading ratio guidelines do not apply because the design does not propose an infiltration BMP.

Disturbed Area

To meet Standard Worksheet 10 guidelines, 90% of the disturbed area is contained by the proposed PCSM BMPs.

Karst Topography

The Juniata Valley Road block valve site is located within the vicinity of known depressions or sinkholes. Several design principles were incorporated to minimize the risk of sinkholes to the maximum extent practicable, including reducing the proposed impervious area to the maximum extent practicable.

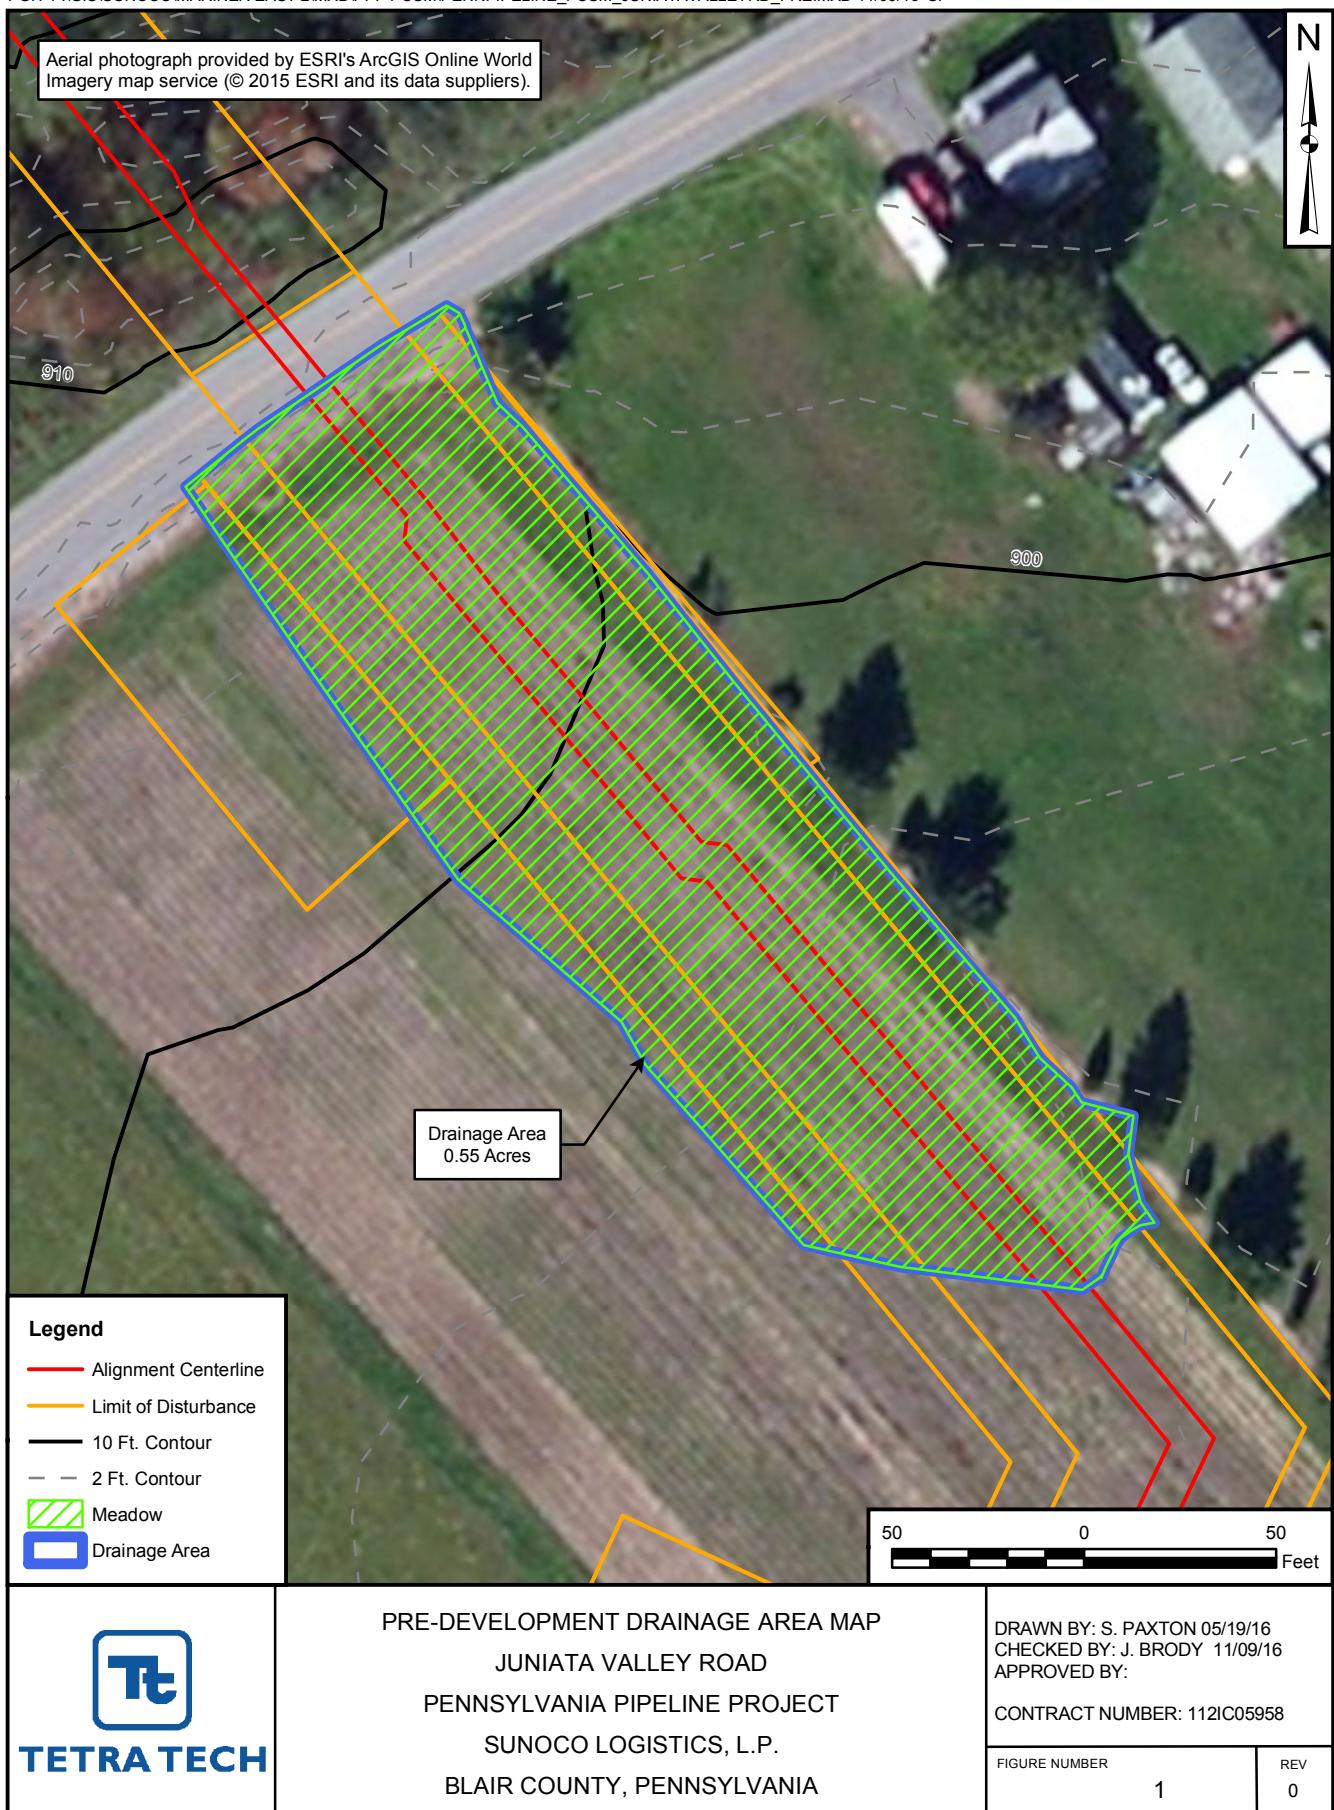

Stormwater runoff from the site is managed using a slow-release BMP. This type of BMP will mimic the normal baseflow hydrology. This BMP will collect, store and filter captured runoff through a water quality

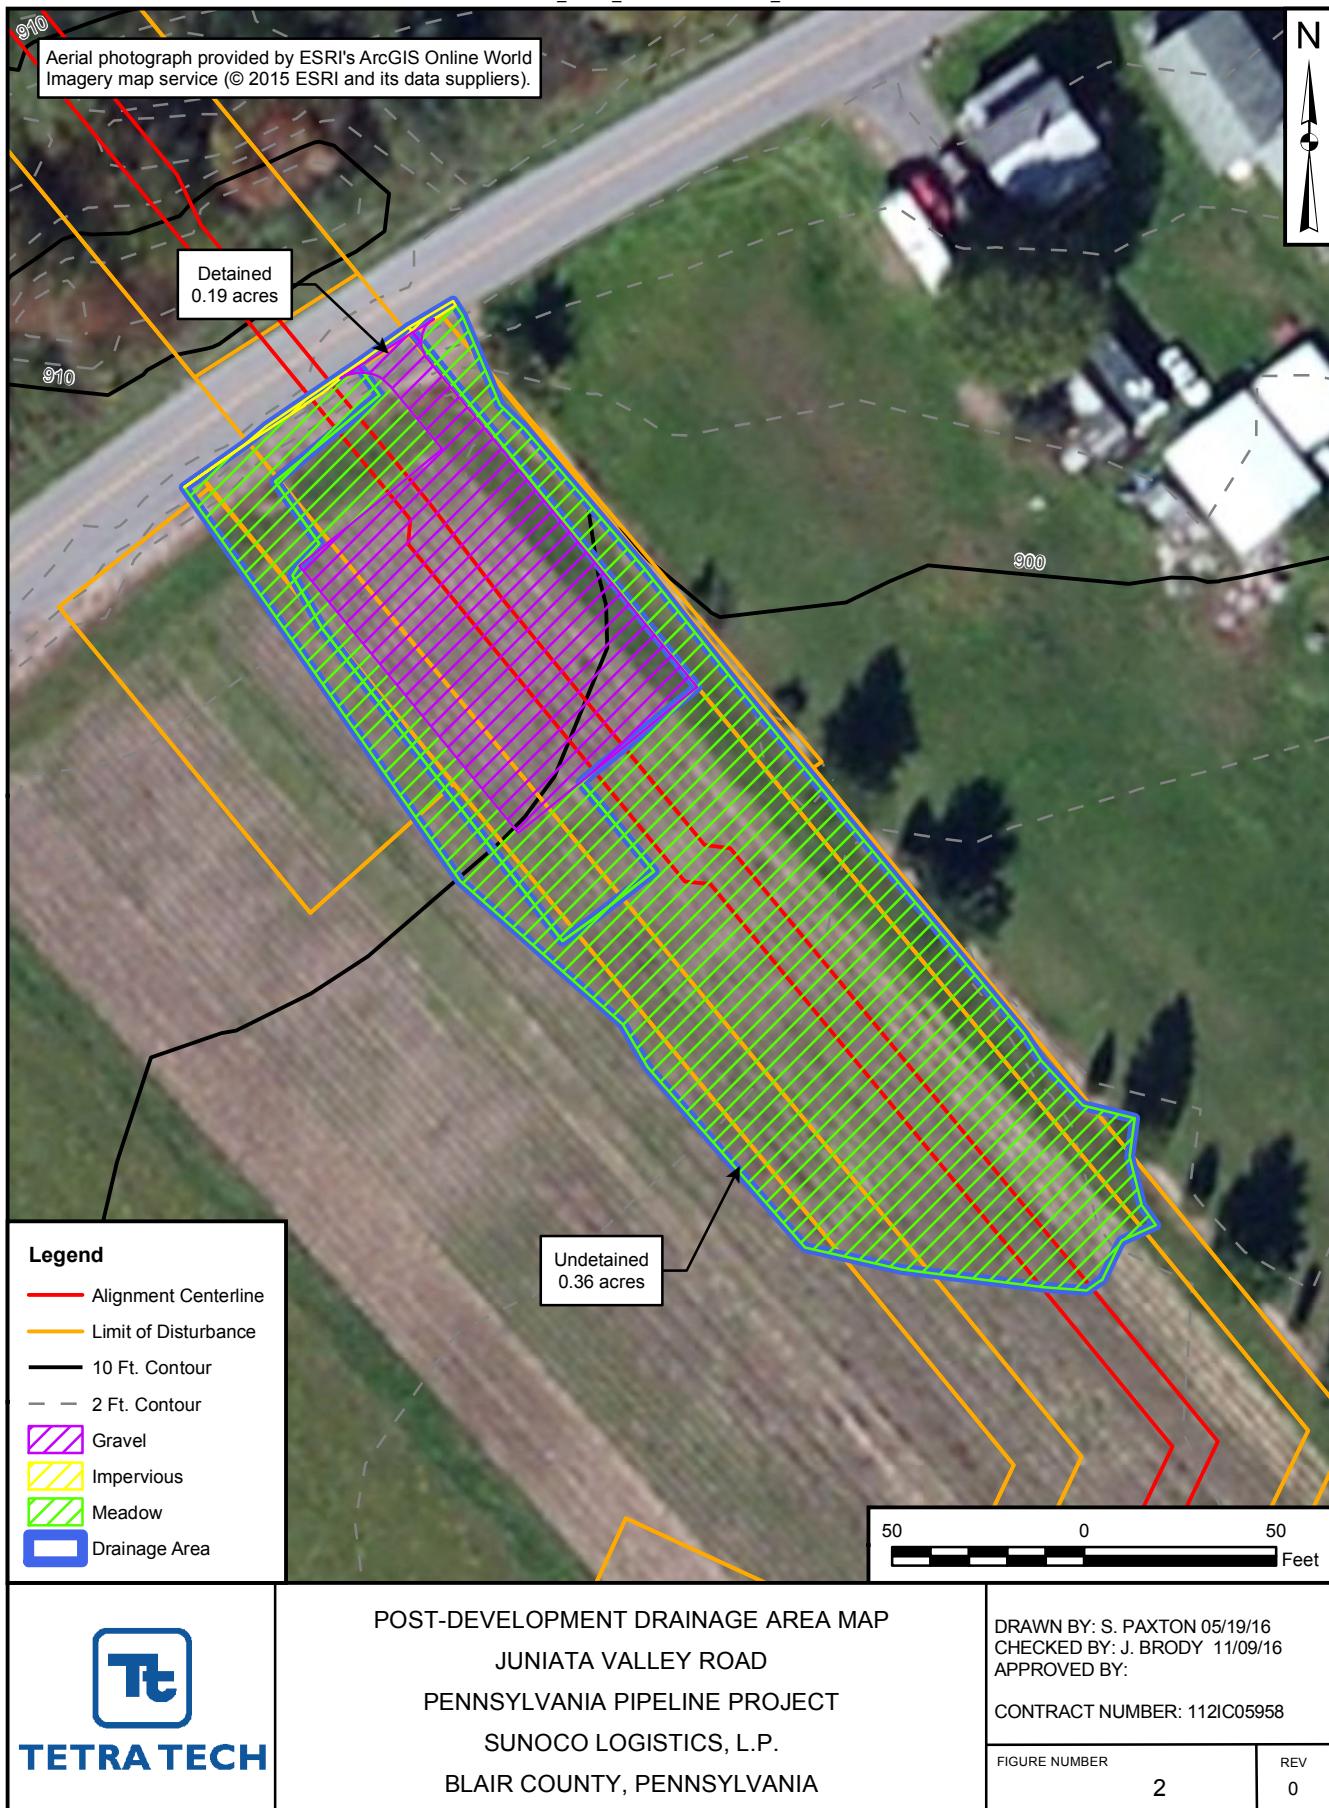

media and slowly release the treated volume through an underdrain. Utilization of a slow-release BMP will reduce the risks associated with karst topography.

Additional post-construction inspection and maintenance will be required onsite as documented in the Sinkhole Repair Plan in Attachment 2. In areas of known karst terrain, stormwater BMPs shall be inspected at regular intervals of at least once every quarter for the first two years following installation and then at regular periods thereafter. Inspections shall also be made after every storm event greater than 1 inch during the establishment period. Inspections shall consist of an examination of any noticeable subsidence, surface depressions, or sinkholes. Inspections shall include an evaluation of all inlet and outlet structures and document any areas to be cleaned, maintained, or repaired.

Special Protection Watershed

Juniata Valley Road block valve is not located within a special protection watershed, so antidegradation requirements do not apply.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

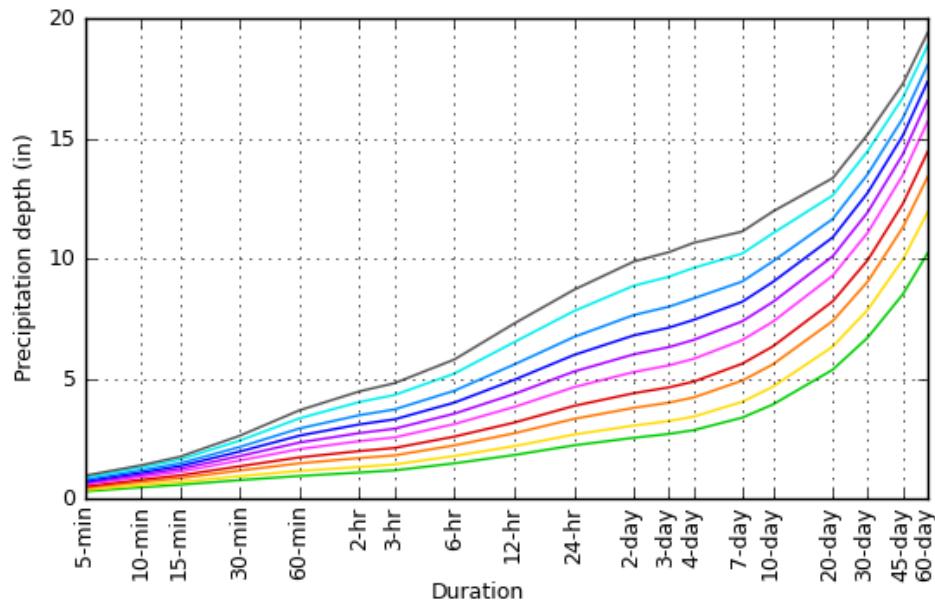

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

WORKSHEET 1. GENERAL SITE INFORMATION

Date: November 11, 2016

Project Name: Juniata Valley Road

Municipality: Frankstown

County: Blair

Total Area (acres): 0.55

Major River Basin: Susquehanna River

Watershed: Frankstown Branch - Juniata River

Sub Basin: Little Juniata River

Nearest Surface Water to Receive Runoff: Unnamed Tributary to Frankstown Branch

Chapter 93 - Designated Water Use: Warm Water Fishes (WWF)

Impaired according to Chapter 303(d) list?

YES
NO

List Causes of Impairment:

Industrial Point Source - Suspended Solids

Is Project Subject to, or Part of:

Municipal Separate Storm Sewer System (MS4) Requirements

YES
NO
YES
NO

Existing or Planned drinking water supply?

If yes, distance from proposed discharge (miles): _____

Approved Act 167 Plan?

YES
NO
YES
NO

Existing River Conservation Plan?

WORKSHEET 4. CHANGE IN RUNOFF VOLUME FOR 2-YR STORM EVENT

PROJECT:	Juniata Valley Road
Drainage Area:	0.55 acres

TOTAL:		22,651	0.52					1,616

2-Year Volume Increase (ft ³):	559
--	-----

2-Year Volume Increase = Developed Conditions Runoff Volume - Existing Conditions Runoff Volume

1. Runoff (in) = $Q = (P - 0.2S)2 / (P + 0.8S)$ where

$$P = \text{2-Year Rainfall (in)}$$

$$S = (1000/CN)-10$$

2. Runoff Volume (CF) = $Q \times \text{Area} \times 1/12$

$$Q = \text{Runoff (in)}$$

$$\text{Area} = \text{Land use area (sq. ft.)}$$

Note: Runoff Volume must be calculated for EACH land use type/condition and HSGI.

c = Orifice Coefficient = 0.6

A_o = Perforation Area (sq. ft.) 0.007

G = Grav. Accel. (ft/sec²) 32.2

H = Average Head (ft) = 3.5

Pipe Discharge				
Pipe	Pipe Diameter - D (in)	Pipe Roughness Coefficient - n	Pipe Slope - S ⁶	Flow Rate (cfs) ⁷
1	4	0.012	0.011111111	0.22
2	N/A	N/A	N/A	N/A
Total Flow Rate (cfs)				0.22

6. For flat pipe, use hydraulic grade (pipe diameter/pipe length) for the pipe slope

7. From Manning's equation (attach separate calculation worksheet)

Limiting flow rate from combined underdrain system - Q _l (cfs) =	0.003
Detained volume based on 2-year/24-hour storm (cu-ft) =	630
Total Dewatering Volume including volume in voids(cu-ft) =	702
Dewatering Time (sec) = 2HA/Q _l =	234,000
Dewatering Time (hrs) =	65.00

Underdrain Outlets Report

Label	Solve For	Friction Method	Roughness Coefficient
Circular Pipe - 1	Full Flow Capacity	Manning Formula	0.012
Slow Release Outlet	Full Flow Capacity	Manning Formula	0.012
Channel Slope (ft/ft)	Normal Depth (ft)	Diameter (ft)	Discharge (ft³/s)
