**RE: Quarterly Groundwater Report: 1st Quarter 2024
Basin 5, Disposal Area 8, and Pyrite Tomb Area
Brunner Island, LLC**

Dear Mr. Long:

Please accept this letter and attachments as the quarterly report for Basin 5 at the Brunner Island Steam Electric Station.

Note that a data table (water depth and pH) and associated trend plots for pyrite tomb standpipe monitoring have been added to this Basin 5 report, beginning with the second quarter 2017 groundwater report.

The analytical results are provided on Form 14R (enclosed) in accordance with the Basin 5 closure plan approved by the PADEP in December 2000. A summary table of results, an Excel spreadsheet file, and maps showing well locations are also enclosed.

Please call or email me with any questions. Thank you.

Sincerely,

A handwritten signature in black ink that reads "M. E. Mengel".

Groundwater Monitoring Report – 1st Quarter 2024

Brunner Island, LLC - Basin 5

Brunner Island Steam Electric Station

BACKGROUND

The Brunner Island Steam Electric Station (Brunner Island SES) is located in York Haven, York County, Pennsylvania and is owned and operated by Brunner Island, LLC (Brunner). An overall Brunner Island SES map and a basin specific map are attached (Attachments 3 and 4).

The PADEP issued Residual Waste Permit # 301337 on December 28, 2000, approving the Basin 5 closure plan. The residual waste permit expired on December 27, 2007 and was not renewed by the PADEP. Brunner believes that Mandatory Abatement Trigger Levels (MATLs) no longer apply to Basin 5, as a result of the permit expiration, and therefore, Brunner no longer uses MATLs as the primary data screening tool for Basin 5 groundwater results.

Disposal Area 8 (a Class 2 residual waste landfill) was constructed on top of Basin 5. Construction was completed and disposal into the landfill began in late 2008. The permitted area for the landfill encompasses approximately 20 acres, however, currently only 9 acres have been constructed and are actively utilized. The existing groundwater monitoring network for Basin 5 was chosen and approved by the PADEP to serve as the monitoring network for Area 8 as well.

In accordance with Brunner's PADEP-approved *Workplan – Groundwater Risk Evaluation – Ash Basin 4 and Pyrite Tomb* dated September 29, 2016, a downgradient monitoring well MW-PT-1 was installed in January 2017 to help assess potential impacts from the pyrite tomb. Additionally, pH and liquid depth monitoring data and associated trend plots for water within the pyrite tomb standpipe have been added to this Basin 5 report, beginning with the second quarter of 2017.

In accordance with the closure/ post closure use plan, construction of the rail extension on Basin 5 was completed in 2013. As a result, moderate subsurface disturbance has occurred in the area.

Groundwater monitoring in the vicinity of Basin 5 is currently conducted quarterly as required in accordance with the approved Basin 5 closure plan. This groundwater monitoring generally includes sampling wells upgradient and downgradient of Basin 5 for indicator parameters of fly ash such as arsenic, boron, lithium, selenium, strontium, and total dissolved solids. Other parameters are routinely monitored in the vicinity of Basin 5 in accordance with permit requirements and are listed on the attached summary table of quarterly groundwater monitoring results (Attachment 1). Brunner reviews current and historical data (approximately the past 10 years) to identify trends and to compare data with Pennsylvania Act 2 residential Statewide Health Standards for used aquifers and/or EPA National Drinking Water Standards.

A groundwater recovery system was installed on the northern portion of Ash Basin 5 to abate apparent migration of dissolved constituents from the Pyrite Tomb area (located on the northeast corner of Ash Basin 5) and the Bottom Ash Processing Area (located on the northwest corner of Ash Basin 5). The groundwater recovery system consists of five groundwater recovery wells

designated as RW-5-B1 through RW-5-B5 associated with the Pyrite Tomb, and four groundwater recovery wells designated as RW-5-A1 through RW-5-A4 associated with the Bottom Ash Processing Area. Capture zones were determined to be sufficient as shown in the *Recovery Well Installation and Pumping Test Report* (rev. 1/23/2023). The full-time operation of the groundwater recovery began on February 6, 2024.

The effectiveness of the groundwater abatement (groundwater recovery system) will be based on the capture zones and/or reduction in concentrations of constituents of concern (COCs) in monitoring wells MW-8-4, MW-PT-1, MW-8-8A, MW-8-8B, MW-8-9B, and MW-8-9C on the east side of Ash Basin 5 (Pyrite Tomb area), and monitoring wells MW-8-5A and MW-8-5B on the west side of Ash Basin 5 (Bottom Ash Processing Area). The effectiveness of the recovery system will be evaluated over a 12-quarter period (3-years) based on data starting from the initiation of full-time groundwater recovery operations (February 6, 2024). A groundwater evaluation report is scheduled to be completed in approximately June 2027 to document the effectiveness of groundwater abatement (the report is required within 90 days of the expected March 2027 receipt of the 12th of 12 quarterly groundwater monitoring event results).

GROUNDWATER MONITORING PROGRAM

Monitoring Locations – Basin 5

Downgradient and upgradient monitoring wells for Basin 5 are listed below and shown on the attached Site Plan of Basin 5 (Attachment 4).

- Background monitoring well – MW-19
- Upgradient monitoring well – MW-4-7A
- Downgradient monitoring wells – MW-4-10, MW-8-1N, MW-8-2, MW-8-3A, MW-8-3B, MW-8-4, MW-8-5A, MW-8-5B, MW-8-10A, MW-8-10B, MW-8-10C, MW-8-12C, MW-8-8A, MW-8-8B, MW-8-9B, MW-8-9C, and MW-PT-1
- Pyrite tomb standpipe (lab analytical concluded in 2017; field pH and water elevation monitoring to continue)

Monitoring Schedule

For all the monitoring wells listed above, except MW-8-10C and MW-8-12C, quarterly sampling of field parameters, non-metals, and metals are performed. For MW-8-10C and MW-8-12C, these parameters are only required to be sampled annually during the second calendar quarter. All the monitoring parameters are listed on the attached Summary Table of Basin 5 Groundwater Monitoring Results (Attachment 1). For MW-8-8A, MW-8-8B, MW-8-9B, and MW-8-9C, the only metals analyzed are arsenic, lithium, manganese, and molybdenum (all other Basin 5 field parameters and non-metals are also analyzed). Additionally, for quality assurance/quality control (QA/QC), field blanks and duplicates are routinely collected during each sampling event.

QA/QC Results

For the site-wide monitoring event conducted at Brunner Island SES for the first quarter of 2024, Brunner samplers collected seven field blanks (all groundwater field blanks) and eight duplicate samples. The duplicate samples were collected from eight groundwater wells (including MW-4-2A, MW-4-10, MW-8-3B, MW-6-6, MW-7-5, PZ-7-33, EQ-1, and GC-1N). These field blanks and duplicates were analyzed by the laboratory along with the routinely collected groundwater samples. For the seven field blanks, six water quality parameters were detected above respective limits of quantification (fluoride, iron, lithium, molybdenum, nickel, and nitrate) for a total of eleven analyses. In Brunner's opinion, analysis of the field blanks indicated no significant evidence of sample contamination related to field sampling procedures or sample containers. For the eight duplicates, a total of 450 paired analyses were performed with 17 paired analyses exceeding Brunner's acceptable level of less than 20% relative percent difference (RPD) between duplicates. Based on these QA/QC results, Brunner believes that the laboratory precision is reasonable, and the monitoring results are acceptable for reporting to the PADEP.

GROUNDWATER MONITORING RESULTS

The groundwater sampling results for this quarter are summarized on Attachment 1, Summary Table of Basin 5 Groundwater Monitoring Results. Upgradient and downgradient wells are indicated in the headings at the top of this table. Any groundwater concentrations that exceeded the listed regulatory standards are indicated in red text color. Groundwater monitoring results are also reported on the 14R forms for each well (Attachment 5).

Below are the findings for each Basin 5 monitoring well:

Upgradient Monitoring Well (MW-4-7A)

Upgradient monitoring well MW-4-7A is located near the northwest corner of Basin 5 and serves as an upgradient well to the basin. Key results for this quarter and trends for MW-4-7A are as follows:

- pH is consistently near neutral.
- Total dissolved solids concentration of 1,150 mg/L exceeded the Secondary Drinking Water Standard of 500 mg/L, and TDS exhibits a slightly increasing trend.
- Sulfate concentration of 624 mg/L exceeded the Secondary Drinking Water Standard of 250 mg/L, and sulfate exhibits a slightly increasing trend.
- Boron concentrations have been relatively stable since 2012 and are far below the Act 2 residential Statewide Health Standard of 6,000 µg/L, although concentrations at MW-4-7A have fluctuated upward slightly since the fourth quarter of 2018.
- Calcium concentrations historically exhibit a stable long-term trend, but concentrations have exhibited increased variability since the fourth quarter of 2018.
- Lithium (dissolved) concentration of 216 µg/L exceeded the Act 2 residential Statewide Health Standard of 69 µg/L. Lithium concentrations at MW-4-7A have exhibited an

increasing trend since 2011, and now exceed the Act 2 standard (with increased variability since the first quarter of 2020).

- Manganese (dissolved) concentration of 219 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L but did not exceed the Act 2 residential Statewide Health Standard of 300 µg/L. Manganese concentrations are seasonally variable (within a fairly stable range) at MW-4-7A with peak concentrations typically exceeding the Secondary Drinking Water Standard and occasionally exceeding the Act 2 standard.
- Sodium concentrations demonstrate a gradual long-term increasing trend but appear to be stabilizing at about 60 mg/L. Sodium has also exhibited recent increased variability (similar to boron and calcium). There are no EPA drinking water or PA Act 2 standards for sodium.

Downgradient Monitoring Wells

1. MW-4-10 - Monitoring well MW-4-10 is located on the dike between Basin 4 and Basin 5 and would be expected to be more representative of basin pore water than the groundwater surrounding the basin. Relatively significant ash-related impact would be expected and is observed, as compared to monitoring wells which are not bounded by ash on both sides. The general area around MW-4-10 has periodically experienced earth disturbance related to wastewater treatment plant construction. This disturbance has apparently impacted groundwater/pore water quality in MW-4-10. Key results for this quarter and trends for MW-4-10 are as follows:

- Beginning in mid-2018, substantial upward fluctuations (beyond respective historical ranges in many cases) for numerous parameters (including total dissolved solids, sulfate, boron, calcium, specific conductance, and strontium) correlated to increased groundwater elevations. Except for calcium and strontium, these parameters have returned to pre-2018 concentrations.
- Field pH (6.33 S.U.) is below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U. The historical pH range for this well is approximately 4 to 6.5.
- Total dissolved solids concentration of 1,020 mg/L exceeded the Secondary Drinking Water Standard of 500 mg/L. Total dissolved solids exhibit a decreasing trend since 2019. As noted above, following a period of increased concentrations, total dissolved solids have returned to pre-2018 concentrations.
- Sulfate concentration of 1, 502 mg/L exceeded the Secondary Drinking Water Standard of 250 mg/L. Sulfate concentrations exhibit a generally decreasing trend since 2019. However, this quarter, sulfate fluctuated above the recent range of variability.
- Concentrations of aluminum, arsenic, beryllium, cadmium, fluoride, nickel, and zinc have exhibited similar elevated and variable concentration trends for the past few years, with noticeable peaks in 2011, 2014, 2016, and 2018, resulting in some exceedances of respective regulatory standards. Elevated concentrations of these metals are likely related to low pH occurrences when groundwater elevations are high. Since 2022, aluminum concentrations

have been more consistently elevated, fluctuating around the Secondary Drinking Water Standard of 200 µg/L.

- Boron concentrations are elevated and variable (ranging from about 1,500 to 3,500 µg/L) relative to the other Basin 5 wells but meet the Act 2 residential Statewide Health Standard of 6,000 µg/L. Boron exhibits a general decreasing trend since 2012 (except for upward fluctuations from mid-2018 to 2022 as noted above).
 - Iron is present at low concentrations, and typically is below the Secondary Drinking Water Standard. Iron (total) occasionally exceeds the standard.
 - Lithium (dissolved) concentration of 680 µg/L exceeded the Act 2 residential Statewide Health Standard of 69 µg/L. Lithium concentrations at MW-4-10 are the most elevated of all Basin 5 wells but exhibit a slightly decreasing trend since 2012.
 - Manganese (dissolved) concentration of 368 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L. Manganese concentrations are elevated and variable but exhibit a relatively stable long-term trend.
 - Molybdenum (dissolved) concentration of 822 µg/L exceeded the Act 2 residential Statewide Health Standard of 40 µg/L. Molybdenum concentrations at MW-4-10 are the most elevated and variable of the Basin 5 wells, but the long-term trend is decreasing.
 - Potassium and sodium concentrations are elevated relative to the other Basin 5 wells. Potassium demonstrates an increasing trend, while sodium demonstrates a decreasing trend. There are no EPA drinking water or PA Act 2 standards for potassium and sodium.
 - Selenium is variable and demonstrates a long-term increasing trend, similar to the increasing trend at background well MW-19, but more variable since 2014. Concentrations have been below the Act 2 residential Statewide Health Standard of 50 µg/L, except for the fourth quarter of 2018.
2. **MW-8-1N** - MW-8-1 was decommissioned on March 27, 2013, shortly after first quarter 2013 sampling was conducted, to accommodate the footprint of the railroad extension project. MW-8-1 was replaced by MW-8-1N (as installed on September 17, 2013) and quarterly sampling was initiated in the third quarter of 2013. Key results for this quarter and trends for MW-8-1N are as follows:
- pH is near neutral, but slightly acidic, sometimes below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U.
 - Total dissolved solids concentration of 774 mg/L exceeded the Secondary Drinking Water Standard of 500 mg/L. Total dissolved solids concentrations increased after the well was installed (in 2013) until the second quarter of 2015. Since then, concentrations have generally decreased. Specific conductance exhibits a similar trend. These trends for TDS and specific conductance are likely related to similar trends for calcium, magnesium, sodium, strontium, and sulfate at MW-8-1N.

- Sulfate concentration of 344 mg/L exceeded the Secondary Drinking Water Standard of 250 mg/L. Like total dissolved solids, sulfate concentrations had increased until the second quarter of 2015, but concentrations have since decreased and are now below 400 mg/L.
- Boron concentrations are well below the Act 2 residential Statewide Health Standard of 6,000 mg/L and are the lowest of all Basin 5 wells.
- Calcium and magnesium concentrations were elevated (compared to most other Basin 5 wells) from 2015 to 2018, but recent concentrations have decreased similar to the trend for total dissolved solids (discussed above). There are no EPA drinking water or PA Act 2 standards for these parameters.
- Chloride and sodium concentrations have historically been elevated and variable compared to the other Basin 5 wells, but chloride has always been below the Secondary Drinking Water Standard of 250 mg/L. Since 2014 and 2015 respectively, chloride and sodium concentrations have decreased significantly (with variability) and are now comparable to concentrations at several other Basin 5 wells.
- Iron concentrations are elevated and variable relative to most Basin 5 wells, typically exceeding the Secondary Drinking Water Standard of 0.3 mg/L.
- Manganese (dissolved) concentration of 1,420 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L. Manganese concentrations are elevated but exhibit a long-term stable trend with some variability.
- Strontium is usually the most elevated of all the Basin 5 wells (except for recent upward fluctuations at MW-4-10) and exhibits a relatively stable trend since 2015. Strontium concentrations are below the Act 2 residential Statewide Health Standard of 4,000 µg/L.

3. MW-8-2 - Key results for this quarter and trends for MW-8-2 are as follows:

- pH is stable and near neutral, but is occasionally below the Secondary Drinking Water range of 6.5 to 8.5 S.U.
- Sulfate and total dissolved solids had exhibited long-term stable trends below the respective Secondary Drinking Water Standards of 250 mg/L and 500 mg/L. However, concentrations increased during the first quarter of 2023. Since then, total dissolved solids concentrations have been fluctuating around the standard, and sulfate concentrations fluctuate just below the standard.
- Manganese (dissolved) concentration of 328 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L. Concentrations exhibit a long-term stable trend with some variability.
- Molybdenum (dissolved) concentration of 268 µg/L exceeded the Act 2 residential Statewide Health Standard of 40 µg/L. However, concentrations exhibit a fairly stable trend.

- Strontium concentrations exhibits a slight long-term increasing trend but are below the Act 2 residential Statewide Health Standard of 4,000 µg/L.

4. MW-8-3A and MW-8-3B - Key results for this quarter and trends for MW-8-3A and MW-8-3B are as follows:

- pH is stable and near neutral at both wells, but slightly lower at MW-8-3A. pH at MW-8-3A is sometimes slightly below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U.
- Total dissolved solids concentrations at both wells exhibit increasing long-term trends with some variability. Concentrations are higher and more variable at MW-8-3A. The total dissolved solids concentration at MW-8-3A typically exceeds the Secondary Drinking Water Standard of 500 mg/L, while concentrations at MW-8-3B typically fluctuate around the standard.
- Sulfate concentrations in both wells exhibit relatively stable long-term trends with some variability. Sulfate concentrations at MW-8-3A typically fluctuate around the Secondary Drinking Water Standard of 250 mg/L, while concentrations at MW-8-3B are typically below the standard.
- Arsenic (dissolved) concentrations at both wells exhibit stable long-term trends with seasonal variability. Peak concentrations exceed the Primary Drinking Water Standard of 10 µg/L (not since 2011 at MW-8-3B). Dissolved arsenic concentrations at MW-8-3A typically range from 3 to 20 µg/L over the past 10 years. Since 2019, total arsenic at MW-8-3A exhibits increased variability. At MW-8-3B, arsenic concentrations exhibit a decreasing trend since approximately 2019. Brunner believes that relatively permeable material is associated with relic stream channels existing beneath Basin 5, potentially accounting for arsenic detections at wells MW-8-3A and MW-8-3B.
- Iron concentrations at MW-8-3A are variable and exceed the Secondary Drinking Water Standard of 0.3 mg/L (possibly due to impacts from historical pyritic material handling). Iron is present in MW-8-3B, but at much lower concentrations than at MW-8-3A, suggesting possibly more impact in the upper part of the water-bearing zone (and/or possibly a higher iron concentration related to the high turbidity within MW-8-3A groundwater). Peak iron concentrations in MW-8-3B exceed the standard.
- Manganese concentrations in both wells exceed the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L but exhibit long-term stable trends with some variability. Since 2019, manganese at MW-8-3A exhibits increased variability.
- Molybdenum concentrations in both wells normally exceed the Act 2 residential Statewide Health Standard of 40 µg/L but exhibit long-term stable/slight decreasing trends.

5. MW-8-4 - Key results for this quarter and trends for MW-8-4 are as follows:

- Field pH at MW-8-4 is typically below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U., but exhibits an increasing trend.

- Sulfate and total dissolved solids concentrations are elevated and variable at MW-8-4 and exceed Secondary Drinking Water Standards, but exhibit decreasing long-term trends. As a result of the decreasing long-term trends, sulfate and total dissolved solids concentrations fluctuate around the respective standards.
 - Aluminum concentrations are elevated and variable relative to most other Basin 5 wells, sometimes exceeding the Secondary Drinking Water Standard of 200 µg/L.
 - Beryllium, cadmium, nickel, and zinc concentrations had been variable and elevated relative to other Basin 5 wells. However, since 2012, concentrations have generally decreased and have been less variable. These parameters now meet respective regulatory standards.
 - Chloride concentrations are seasonally variable but remain well below the Secondary Drinking Water Standard of 250 mg/L. Peak chloride concentrations have decreased since 2015.
 - Manganese concentrations remain elevated at 3,360 µg/L compared to the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L. Manganese concentrations at MW-8-4 are the most elevated and variable of all the Basin 5 wells, but concentrations exhibit a long-term downward trend with decreasing variability.
- 6. MW-8-5A and MW-8-5B** - These wells are located at the northwestern corner of Basin 5. Key results for this quarter and trends for MW-8-5A and MW-8-5B are as follows:
- pH is stable and near neutral at both wells.
 - Total dissolved solids concentrations are elevated in excess of the Secondary Drinking Water Standard in both wells, with stable long-term trends (current concentrations of 761 and 665 µg/L for MW-8-5A and MW-8-5B, respectively).
 - Sulfate concentrations demonstrate stable long-term trends in MW-8-5A and MW-8-5B with current concentrations of 266 mg/L and 260 mg/L, respectively, compared to the Secondary Drinking Water Standard of 250 mg/L.
 - Arsenic (dissolved) concentrations in MW-8-5A and MW-8-5B are elevated (current concentrations of 122 µg/L and 239 µg/L, respectively) in excess of the Primary Drinking Water Standard of 10 µg/L. Arsenic concentrations at MW-8-5B exhibit a slight decreasing trend, but concentrations have exhibited increased variability since 2019. Concentrations at MW-8-5A exhibit a stable long-term trend.
- Note: PPL's groundwater consultant, Ish Inc., confirmed that Basin 5 is the source of arsenic identified in MW-8-5A and MW-8-5B. As part of the assessment conducted to investigate the elevated arsenic in MW 8-5 area, Ish Inc. established that arsenic attenuates quickly and is not elevated in the new point of compliance wells MW-8-10A and MW 8-10B.
- Lithium concentrations exceed the Act 2 residential Statewide Health Standard of 69 µg/L but demonstrate fairly stable long-term trends at both wells (current concentrations of 186

µg/L and 151 µg/L for MW-8-5A and MW-8-5B, respectively), but concentrations have exhibited increased variability since the fourth quarter of 2019.

- Manganese concentrations exceed the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L in both wells (current concentrations of 475 and 402 µg/L for MW-8-5A and MW-8-5B respectively). Manganese exhibits a slight increasing trend at MW-8-5A and a slight decreasing trend at MW-8-5B.
- Molybdenum concentrations exceed the Act 2 residential Statewide Health Standard of 40 µg/L in both wells (current concentrations of 378 and 342 µg/L for MW-8-5A and MW-8-5B respectively) but exhibit slightly decreasing long-term concentration trends with increased variability since the third quarter of 2019.
- Strontium concentrations exhibit increasing trends in both wells. Strontium concentrations are below the Act 2 residential Statewide Health Standard of 4,000 µg/L.

7. MW-8-10A, MW-8-10B, and MW-8-10C - Monitoring wells MW-8-10A, MW-8-10B, and MW-8-10C were added to the monitoring program as part of Area 8 monitoring system located within Basin 5. These wells also serve as the point of compliance wells, downgradient of MW-8-5A and MW-8-5B. MW-8-10A and MW-8-10B are sampled quarterly while MW-8-10C is sampled annually during the second calendar quarter. Most importantly, arsenic concentrations in MW-8-10A, MW-8-10B, and MW-8-10C continue to meet the Primary Drinking Water Standard of 10 µg/L and exhibit stable/decreasing trends. Other key results and trends for these wells for this quarter are as follows:

- MW-8-10B demonstrates typically slightly alkaline pH and overall better and more stable water quality than MW-8-10A and MW-8-10C. pH at MW-8-10C is also slightly alkaline.
- pH at MW-8-10A is near neutral, but lower than pH at MW-8-10B and MW-8-10C. pH at MW-8-10A is sometimes slightly below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U.
- Sulfate and total dissolved solids concentrations at MW-8-10A exceed the Secondary Drinking Water Standards, and exhibit an increasing trend since 2021 (after previously fluctuating around the respective standards since 2018). These trends appear to be related to similar trends for calcium, magnesium, specific conductivity, and strontium. At MW-8-10B, total dissolved solids concentrations are fairly stable and fluctuate around the 500 mg/L standard. Sulfate concentrations at MW-8-10B are below the 250 mg/L standard and exhibit a slight decreasing trend.
- Iron concentrations at MW-8-10C are variable and occasionally exceed the Secondary Drinking Water Standard of 0.3 mg/L. During the second quarter of 2023, dissolved iron at MW-8-10C fluctuated upward beyond the historical range of variability, exceeding the Secondary Drinking Water Standard of 0.3 mg/L.
- Manganese concentrations at MW-8-10A are elevated and seasonally variable, exceeding the Secondary Drinking Water Standard of 50 µg/L and historically had exceeded the Act 2 residential Statewide Health Standard of 300 µg/L. However, peak manganese

concentrations at MW-8-10A have decreased significantly since 2018 (below the Act 2 standard). Manganese concentrations at MW-8-10C normally exceed both standards but are less variable than at MW-8-10A.

- Molybdenum concentrations at MW-8-10C exceed the Act 2 residential Statewide Health Standard of 40 µg/L, while concentrations at MW-8-10A and MW-8-10B sometimes exceed the standard. Similar to manganese, peak molybdenum concentrations at MW-8-10A have decreased significantly since 2018 and have not exceeded the standard since the first quarter of 2018.
- Vanadium concentrations at MW-8-10B fluctuate around the limit of quantification, but are well below the Act 2 residential Statewide Health Standard of 170 µg/L, which was increased in 2023.
- During the second quarter of 2023, at MW-8-10C, several dissolved metals fluctuated below the historical range of variability including barium, boron, calcium, iron, magnesium, and strontium; and iron fluctuated above the historical range of variability.

8. MW-8-12C - Sampling is required at MW-8-12C annually in the second calendar quarter. Key results and trends for the second quarter of 2023 were as follows:

- Iron (dissolved) concentration of 0.59 mg/L exceeded the Secondary Drinking Water Standard of 0.3 mg/L. Iron concentrations have generally decreased with variability since 2016.
- Manganese (dissolved) concentration of 1,610 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L.
- Molybdenum (dissolved) concentration of 414 µg/L exceeded the Act 2 residential Statewide Health Standard of 40 µg/L. Molybdenum concentrations have fluctuated between approximately 150 and 450 µg/L over the past ten years.
- Several parameters fluctuated downward during the second quarter of 2019 at MW-8-12C including boron, calcium, iron, magnesium, manganese, molybdenum, potassium, specific conductivity, sulfate, total dissolved solids, and total organic carbon. Barium and strontium fluctuated upward. Since the second quarter of 2020, each of these parameters returned to concentrations consistent with respective historical trends.

9. MW-8-8A, MW-8-8B, MW-8-9B, and MW-8-9C – These wells were added to the sampling schedule beginning with the third quarter of 2022. For these wells, the only metals analyzed are arsenic, lithium, manganese, and molybdenum (all other Basin 5 field parameters and non-metals are also analyzed). Key results for this quarter are as follows:

- Arsenic (dissolved) concentrations at these wells ranged from 348 to 718 µg/L, exceeding the Primary Drinking Water Standard of 10 µg/L for each of these wells. Generally arsenic concentration decreases with depth at the locations of paired wells; for example, the concentration is lower at MW-8-9C, which has a deeper screened depth, than at MW-8-9B.

- Lithium (dissolved) concentrations at these wells ranged from 128 to 240 µg/L, exceeding the Act 2 residential Statewide Health Standard of 69 µg/L for each of these wells.
- Manganese (dissolved) concentrations at these wells ranged from non-detect to 1,320 µg/L, exceeding the Act 2 residential Statewide Health Standard of 300 µg/L for three of these wells.
- Molybdenum (dissolved) concentrations at these wells ranged from 219 to 336 µg/L, exceeding the Act 2 residential Statewide Health Standard of 40 µg/L for each of these wells.
- Sulfate concentrations at these wells ranged from 146 to 314 mg/L, exceeding the Secondary Water Standard of 250 mg/L for two of these wells.
- Total dissolved solids concentrations at these wells ranged from 497 to 1,000 mg/L, exceeding the Secondary Drinking Water Standard of 500 mg/L for three of these wells.

Pyrite Tomb Monitoring

1. **Pyrite Tomb Standpipe** – The pyrite tomb is monitored at least monthly for water depth and field pH, and quarterly reporting (via this quarterly groundwater report) began in the 2nd quarter of 2017. Brunner planned to collect two additional (last) samples from the pyrite tomb standpipe during the 3rd and 4th quarters of 2017 for laboratory analysis (as previously). However, on both quarterly sampling occasions, the standpipe contained too little water to sample (lack of water is a favorable condition). A summary table of the field monitoring results for 2017 thru current is provided in Attachment 2. Trend plots for the field parameters (pH, water depths, water elevations) are provided with the electronic submission of this report.
2. **MW-PT-1** – Downgradient monitoring well MW-PT-1 was installed in January 2017 to help assess the Pyrite Tomb area. This well is located outside of the Basin 5 berm material in native alluvial sediments. Since monitoring of MW-PT-1 commenced, many parameters have exhibited significant variability. Analytical results for the pyrite tomb monitoring well MW-PT-1 are included on Attachment 1, *Summary Table of Basin 5 Groundwater Monitoring Results*, and trend plots for these parameters (as applicable) are provided with the electronic submission of this report. Key results for this quarter are as follows:
 - pH (5.07 S.U.) was below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U. Lower pH and alkalinity values at MW-PT-1 appear to correlate with higher groundwater elevations.
 - Total dissolved solids concentration of 539 mg/L exceeded the Secondary Drinking Water Standard of 500 mg/L.
 - Since 2022, nitrate concentrations at MW-PT-1 have been more variable, occasionally exceeding the Primary Drinking Water Standard of 10 mg/L.
 - Sulfate concentration of 332 mg/L exceeded the Secondary Drinking Water Standard of 250 mg/L.

- Aluminum (total) concentration of 982 µg/L exceeded the Secondary Drinking Water Standard of 200 µg/L.
- Manganese (total) concentration of 1,590 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and Act 2 residential Statewide Health Standard of 300 µg/L.

- Notes:**
- Regulatory qualifier codes: M = EPA Primary Drinking Water MCL/TT, S = EPA Secondary Drinking Water MCL, and A = Pennsylvania Act 2 residential Statewide Health Standard for used aquifers.
 - MW-19 was sampled for additional parameters (Ga, Ge, Rb, Y) pursuant to Basin No. 7 sampling requirements.
 - MW-4-7A, MW-4-10, and MW-19 are additionally sampled for organic parameters during the second and third calendar quarters pursuant to Basin No. 4 South sampling requirements.
 - MW-8-10C and MW-8-12C are sampled annually during the second calendar quarter.

Attachment – Statistics Summary

Statistical Analysis

Temporal trends of selected parameters were analyzed using a Theil-Sen estimator, a robust linear regression method. The Theil-Sen estimator is insensitive to outlying spikes in data, making it advantageous over the traditional least squares method of linear regression in identifying significant temporal trends. To comply with proposed RCRA Subtitle D regulations, a nonparametric analysis of variants (ANOVA) of the data is also utilized. The nonparametric ANOVA analysis is a method for comparing medians of two or more groups. In this case, it is utilized to determine if parameter concentrations in downgradient wells are significantly greater than or less than parameter concentrations in the upgradient wells.

An Excel workbook was developed to evaluate historical groundwater monitoring data from Talen sites with the aforementioned statistical tools. This Excel application was used to perform statistical analyses of each site-related groundwater parameter at all monitoring locations for each basin/area of the site. The Excel workbook includes a worksheet containing a summary table of the statistical analyses results for all groundwater parameters and monitoring locations along with other supporting worksheets containing raw data and more detailed statistical information. The most pronounced parameter trends and regulatory exceedances are highlighted on the summary table.

Notes:

1. Upgradient vs downgradient represents the ratio of average concentration in all downgradient wells to average concentration of all upgradient wells (i.e. how many times greater is the concentration in downgradient v
2. Rows are sorted according to "Upgradient vs. Downgradient" ratio. Parameters with higher downgradient concentrations are on top (orange formatting indicates greater downgradient concentrations; blue formatting in
3. Sub-headings for each location are as follows:

Trend (%) :	Percent increase/decrease in concentration of the Theil-Sen trendline over 10-year period (red arrow = increase; blue arrow = decrease; arrow size is proportional to increase/decrease).
p :	p-value of Theil-Sen trend.
$\bar{x}$:	Mean measured concentration over time frame.
$\bar{x}$ (%)	Proportion of $\bar{x}$ to applicable standard (red formatting indicates $\bar{x}$ is 1000% of the standard; orange formatting indicates $\bar{x}$ is 100% of the standard; gradation of orange and red are proportional to
n :	Number of samples over time frame.
ND :	Number of "non-detect" samples over time frame. For concentrations between LOD and LOQ (reported as "< LOQ"), the LOQ is treated as an additional detection limit in the analysis.
J :	Number of samples with estimated concentrations (J-values). Currently concentrations between LOD and LOQ are reported as "< LOQ" instead of estimated values.
> :	Number of exceedances over time frame; date of most recent exceedance.
Max :	Maximum measured concentration over time frame; date of maximum concentration.
p (comparison) :	p-value of two-group comparison analysis (comparison to upgradient wells). Analysis test results based on either: p = parametric (t-test) or n = nonparametric (Wilcoxon test); determined based on number of detections and Shapiro-Wilk (S-W) normality test results. If p-value of normality test for either group is < 0.05 then defaults to nonparametric comparison (Wilcoxon test). If p (comparison) < 0.05 then: < Up means data are statistically less than upgradient data; > Up means data are statistically greater than upgradient data.

4. "NC" refers to not calculated (when there is insufficient data to run statistical analysis).

Chloride, total as Cl [mg/l]

Chromium, dissolved [$\mu\text{g}/\text{l}$]

NOTE: Data does not exceed standard of 100 $\mu\text{g}/\text{l}$ during this time frame

Chromium, total [µg/l]

NOTE: Data does not exceed standard of 100 µg/l during this time frame

Copper, dissolved [$\mu\text{g/l}$]

NOTE: Data does not exceed standard of 1000 $\mu\text{g/l}$ during this time frame

Copper, total [$\mu\text{g/l}$]

NOTE: Data does not exceed standard of 1000 $\mu\text{g/l}$ during this time frame

Depth to Water [ft]

Dissolved Oxygen, field [mg/l]

NOTE: There are no applicable standards for this parameter

Fluoride, total as F [mg/l]

NOTE: Data does not exceed standard of 2 mg/l during this time frame

Iron, dissolved [mg/l]

Iron, total [mg/l]

Lead, dissolved [$\mu\text{g/l}$]

NOTE: Data does not exceed standard of 5 $\mu\text{g/l}$ during this time frame

Lead, total [$\mu\text{g}/\text{l}$]

NOTE: Data does not exceed standard of 5 $\mu\text{g}/\text{l}$ during this time frame

Lithium, dissolved [$\mu\text{g/l}$]

Lithium, total [$\mu\text{g/l}$]

Magnesium, dissolved [mg/l]

NOTE: There are no applicable standards for this parameter

Magnesium, total [mg/l]

NOTE: There are no applicable standards for this parameter

Manganese, dissolved [$\mu\text{g/l}$]

Manganese, total [µg/l]

Mercury, dissolved [$\mu\text{g/l}$]

NOTE: Data does not exceed standard of 2 $\mu\text{g/l}$ during this time frame

Mercury, total [$\mu\text{g/l}$]

NOTE: Data does not exceed standard of 2 $\mu\text{g/l}$ during this time frame

Molybdenum, dissolved [$\mu\text{g/l}$]

Molybdenum, total [$\mu\text{g/l}$]

Nickel, dissolved [$\mu\text{g/l}$]

Nickel, total [µg/l]

Nitrate, as N [mg/l]

pH, field [s.u.]

pH, lab [s.u.]

Potassium, dissolved [mg/l]

NOTE: There are no applicable standards for this parameter

Potassium, total [mg/l]

Redox, field [mv]
