**RE: Quarterly Groundwater Report: 3rd Quarter 2021
Basin 5, Disposal Area 8, and Pyrite Tomb Area
Brunner Island, LLC**

Dear Mr. Fritz:

Please accept this letter and attachments as the quarterly report for Basin 5 at the Brunner Island Steam Electric Station.

Note that a data table (water depth and pH) and associated trend plots for pyrite tomb standpipe monitoring have been added to this Basin 5 report, beginning with the second quarter 2017 groundwater report.

The analytical results are provided on Form 14Rs (enclosed) in accordance with the Basin 5 closure plan approved by the PADEP in December 2000. A summary table of results, an Excel spreadsheet file (on CD), and maps showing well locations are also enclosed.

Please call or email me with any questions. Thank you.

Sincerely,

A handwritten signature in black ink that reads "M. E. Mengel". The signature is written in a cursive, flowing style.

Groundwater Monitoring Report – Third Quarter 2021

Brunner Island, LLC - Basin 5

Brunner Island Steam Electric Station

BACKGROUND

The Brunner Island Steam Electric Station (Brunner Island SES) is located in York Haven, York County, Pennsylvania. An overall Brunner Island SES map and a basin specific map are attached (Attachments 3 and 4).

The PADEP issued Residual Waste Permit # 301337 on December 28, 2000, approving the Basin 5 closure plan. The residual waste permit expired on December 27, 2007 and was not renewed by the PADEP. Talen believes that Mandatory Abatement Trigger Levels (MATLs) no longer apply to Basin 5, as a result of the permit expiration, and therefore, Talen no longer uses MATLs as the primary data screening tool for Basin 5 groundwater results.

Disposal Area 8 (a Class 2 residual waste landfill) was constructed on top of Basin 5. Construction was completed and disposal into the landfill began in late 2008. The permitted area for the landfill encompasses approximately 20 acres, however, currently only 9 acres have been constructed and only 4 acres are actively utilized. The existing groundwater monitoring network for Basin 5 was chosen and approved by the PADEP to serve as the monitoring network for Area 8 as well.

In accordance with Talen's PADEP-approved *Workplan – Groundwater Risk Evaluation – Ash Basin 4 and Pyrite Tomb* dated September 29, 2016, a downgradient monitoring well MW-PT-1 was installed in January 2017 to help assess potential impacts from the pyrite tomb. Additionally, pH and liquid depth monitoring data and associated trend plots for water within the pyrite tomb standpipe have been added to this Basin 5 report, beginning with the second quarter of 2017.

In accordance with the closure/ post closure use plan, construction of the rail extension on Basin 5 was completed in 2013. As a result, moderate subsurface disturbance has occurred in the area.

Groundwater monitoring in the vicinity of Basin 5 is currently conducted quarterly as required in accordance with the approved Basin 5 closure plan. This groundwater monitoring generally includes sampling wells upgradient and downgradient of Basin 5 for indicator parameters of fly ash such as arsenic, boron, lithium, selenium, strontium, and total dissolved solids. Other parameters are routinely monitored in the vicinity of Basin 5 in accordance with permit requirements and are listed on the attached summary table of quarterly groundwater monitoring results (Attachment 1). Talen reviews current and historical data (approximately the past 10 years) to identify trends and to compare data with Pennsylvania Act 2 residential Statewide Health Standards for used aquifers and/or EPA National Drinking Water Standards.

GROUNDWATER MONITORING PROGRAM

Monitoring Locations – Basin 5

Downgradient and upgradient monitoring wells for Basin 5 are listed below and shown on the attached Site Plan of Basin 5 (Attachment 4).

- Background monitoring well – MW-19
- Upgradient monitoring well – MW-4-7A
- Downgradient monitoring wells – MW-4-10, MW-8-1N, MW-8-2, MW-8-3A, MW-8-3B, MW-8-4, MW-8-5A, MW-8-5B, MW-8-10A, MW-8-10B, MW-8-10C, MW-8-12C, and MW-PT-1
- Pyrite tomb standpipe (lab analytical concluded in 2017; field pH and water elevation monitoring to continue)

Monitoring Schedule

For all the monitoring wells listed above, except MW-8-10C and MW-8-12C, quarterly sampling of field parameters, non-metals, and metals are performed. For MW-8-10C and MW-8-12C, these parameters are only required to be sampled annually during the second calendar quarter. All the monitoring parameters are listed on the attached Summary Table of Basin 5 Groundwater Monitoring Results (Attachment 1). Additionally, for quality assurance/quality control (QA/QC), field blanks and duplicates are routinely collected during each sampling event.

QA/QC Results

For the site-wide monitoring event conducted at Brunner Island SES for the third quarter of 2021, Talen samplers collected seven field blanks (all groundwater field blanks) and seven duplicate samples. The duplicate samples were collected from seven groundwater wells (including CL-8B, MW-4-7A, MW-8-5A, MW-6-3N, MW-7-3, EQ-1, and GC-1N). These field blanks and duplicates were analyzed by the laboratory along with the routinely collected groundwater samples. For the seven field blanks, six water quality parameters were detected above respective limits of quantification (calcium, copper, iron, lead, molybdenum, and total organic carbon) for a total of ten analyses. In Talen's opinion, analysis of the field blanks indicated no significant evidence of sample contamination related to field sampling procedures or sample containers. For the seven duplicates, a total of 378 paired analyses were performed with five paired analyses exceeding Talen's acceptable level of less than 20% relative percent difference (RPD) between duplicates. Based on these QA/QC results, Talen believes that the laboratory precision is reasonable, and the monitoring results are acceptable for reporting to the PADEP.

GROUNDWATER MONITORING RESULTS

The groundwater sampling results for this quarter are summarized on Attachment 1, Summary Table of Basin 5 Groundwater Monitoring Results. Upgradient and downgradient wells are indicated in the headings at the top of this table. Any groundwater concentrations that exceeded the listed regulatory standards are indicated in red text color. Groundwater monitoring results are also reported on the 14R forms for each well (Attachment 5).

Below are the findings for each Basin 5 monitoring well:

Upgradient Monitoring Well (MW-4-7A)

Upgradient monitoring well MW-4-7A is located near the northwest corner of Basin 5 and serves as an upgradient well to the basin. Key results for this quarter and trends for MW-4-7A are as follows:

- pH is consistently near neutral.
- Total dissolved solids concentration of 1,260 mg/L exceeded the Secondary Drinking Water Standard of 500 mg/L, and TDS exhibits a slightly increasing trend.
- Sulfate concentration of 668 mg/L exceeded the Secondary Drinking Water Standard of 250 mg/L, and sulfate exhibits a slightly increasing trend.
- Boron concentrations have been relatively stable since 2012 and are far below the Act 2 residential Statewide Health Standard of 6,000 µg/L, although concentrations at MW-4-7A have fluctuated upward slightly since the fourth quarter of 2018.
- Calcium concentrations historically exhibit a stable long-term trend, but concentrations have exhibited increased variability since the fourth quarter of 2018.
- Lithium (dissolved) concentration of 211 µg/L exceeded the Act 2 residential Statewide Health Standard of 83 µg/L. Lithium concentrations at MW-4-7A have exhibited an increasing trend since 2011, and now exceed the Act 2 standard (with increased variability since the first quarter of 2020).
- Manganese (dissolved) concentration of 263 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L but did not exceed the Act 2 residential Statewide Health Standard of 300 µg/L. Manganese concentrations are seasonally variable (within a fairly stable range) at MW-4-7A with peak concentrations typically exceeding the Secondary Drinking Water Standard and occasionally exceeding the Act 2 standard.
- Sodium concentrations demonstrate a gradual long-term increasing trend, but appear to be stabilizing at about 60 mg/L. Sodium has also exhibited recent increased variability (similar to boron and calcium). There are no EPA drinking water or PA Act 2 standards for sodium.

Downgradient Monitoring Wells

1. **MW-4-10** - Monitoring well MW-4-10 is located on the dike between Basin 4 and Basin 5 and would be expected to be more representative of basin leachate than the groundwater surrounding the basin. Relatively significant ash-related impact would be expected and is observed, as compared to monitoring wells which are not bounded by ash on both sides. The general area around MW-4-10 has periodically experienced earth disturbance related to wastewater treatment plant construction. This disturbance has apparently impacted groundwater/leachate quality in MW-4-10. Key results for this quarter and trends for MW-4-10 are as follows:

- Recent (since mid-2018) substantial upward fluctuations (beyond respective historical ranges in many cases) for numerous parameters (including total dissolved solids, sulfate, boron, calcium, selenium, specific conductance, and strontium) appear to be related to recent increased groundwater elevations. These parameters have decreased since mid-2019 but remain somewhat elevated, except for selenium which has decreased to within the prior historical range.
- Field pH (5.90 S.U.) is below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U. The historical pH range for this well is approximately 4 to 6.5.
- Total dissolved solids concentration of 1,210 mg/L exceeded the Secondary Drinking Water Standard of 500 mg/L. Historically, total dissolved solids concentrations typically vary from about 700 to 1,300 mg/L but generally exhibit a long-term stable trend. However, since 2018, total dissolved solids have been higher than the typical historical range (due to the upward fluctuations noted above).
- Sulfate concentration of 686 mg/L exceeded the Secondary Drinking Water Standard of 250 mg/L. Sulfate concentrations typically vary from about 400 to 1,050 mg/L, but generally exhibit a long-term stable trend, with increased variability since 2018.
- Concentrations of aluminum, arsenic, beryllium, cadmium, fluoride, nickel, and zinc have exhibited similar elevated and variable concentration trends for the past few years, with noticeable peaks in 2011, 2014, 2016, and 2018, resulting in some exceedances of respective regulatory standards. Elevated concentrations of these metals are likely related to low pH occurrences when groundwater elevations are high.
- Boron concentrations are elevated and variable (ranging from about 1,000 to 4,500 µg/L) relative to the other Basin 5 wells, but meet the Act 2 residential Statewide Health Standard of 6,000 µg/L. Boron exhibits a general decreasing trend since 2012 (except for upward fluctuations since mid-2018 as noted above).
- Iron is present at low concentrations, and typically is below the Secondary Drinking Water Standard. Iron (total) occasionally exceeds the standard
- Lithium (dissolved) concentration of 1,130 µg/L exceeded the Act 2 residential Statewide Health Standard of 83 µg/L. Lithium concentrations at MW-4-10 are the most elevated of all Basin 5 wells and exhibit a general long-term increasing trend, which appears to be stabilizing/decreasing since 2012.
- Manganese (dissolved) concentration of 1,360 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L. Manganese concentrations are elevated and variable, but exhibit a relatively stable long-term trend.
- Molybdenum (dissolved) concentration of 695 µg/L exceeded the Act 2 residential Statewide Health Standard of 40 µg/L. Molybdenum concentrations at MW-4-10 are the most elevated and variable of the Basin 5 wells, but the long-term trend is decreasing.

- Potassium and sodium concentrations are elevated relative to the other Basin 5 wells. Potassium demonstrates an increasing trend, while sodium demonstrates a decreasing trend. There are no EPA drinking water or PA Act 2 standards for potassium and sodium.
 - Selenium is seasonally variable and demonstrates a long-term increasing trend, similar to the increasing trend at background well MW-19, but more variable since 2014. Concentrations have been below the Act 2 residential Statewide Health Standard of 50 µg/L, except for the fourth quarter of 2018.
- 2. MW-8-1N** - MW-8-1 was decommissioned on March 27, 2013, shortly after first quarter 2013 sampling was conducted, to accommodate the footprint of the railroad extension project. MW-8-1 was replaced by MW-8-1N (as installed on September 17, 2013) and quarterly sampling was initiated in the third quarter of 2013. Key results for this quarter and trends for MW-8-1N are as follows:
- pH is near neutral, but slightly acidic, sometimes below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U.
 - Total dissolved solids concentration of 848 mg/L exceeded the Secondary Drinking Water Standard of 500 mg/L. Total dissolved solids concentrations increased after the well was installed (in 2013) until the second quarter of 2015. Since then, concentrations have generally decreased. Specific conductance exhibits a similar trend. These trends for TDS and specific conductance are likely related to similar trends for calcium, magnesium, sodium, strontium, and sulfate at MW-8-1N.
 - Sulfate concentration of 382 mg/L exceeded the Secondary Drinking Water Standard of 250 mg/L. Like total dissolved solids, sulfate concentrations had increased until the second quarter of 2015, but concentrations have since decreased and are now below 400 mg/L.
 - Boron concentrations are well below the Act 2 residential Statewide Health Standard of 6,000 mg/L, and are the lowest of all Basin 5 wells.
 - Calcium and magnesium concentrations were elevated (compared to most other Basin 5 wells) from 2015 to 2018, but recent concentrations have decreased similar to the trend for total dissolved solids (discussed above). There are no EPA drinking water or PA Act 2 standards for these parameters.
 - Chloride and sodium concentrations have historically been elevated and variable compared to the other Basin 5 wells, but chloride has always been below the Secondary Drinking Water Standard of 250 mg/L. Since 2014 and 2015 respectively, chloride and sodium concentrations have decreased significantly (with variability), and are now comparable to concentrations at several other Basin 5 wells.
 - Iron (total) concentration of 1.67 mg/L exceeded the Secondary Drinking Water Standard of 0.3 mg/L. Iron concentrations are elevated and variable relative to most Basin 5 wells.
 - Manganese (dissolved) concentration of 1,500 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L.

Manganese concentrations are elevated, but exhibit a long-term stable trend with some variability.

- Strontium is usually the most elevated of all the Basin 5 wells (except for recent upward fluctuations at MW-4-10) and exhibits a decreasing trend since 2015 similar to total dissolved solids (discussed above). Strontium concentrations are below the Act 2 residential Statewide Health Standard of 4,000 µg/L.

3. MW-8-2 - Key results for this quarter and trends for MW-8-2 are as follows:

- pH is stable and near neutral, but is occasionally below the Secondary Drinking Water range of 6.5 to 8.5 S.U.
- Sulfate and total dissolved solids exhibit relatively stable trends, and concentrations are below respective Secondary Drinking Water Standards of 250 mg/L and 500 mg/L.
- Manganese (dissolved) concentration of 419 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L. Concentrations exhibit a long-term stable trend with some variability.
- Molybdenum (dissolved) concentration of 301 µg/L exceeded the Act 2 residential Statewide Health Standard of 40 µg/L. However, concentrations exhibit a fairly stable trend.
- Strontium concentrations had evidenced a slight long-term increasing trend, but have stabilized around 400 to 500 µg/L since 2011. Strontium concentrations are below the Act 2 residential Statewide Health Standard of 4,000 µg/L.

4. MW-8-3A and MW-8-3B - Key results for this quarter and trends for MW-8-3A and MW-8-3B are as follows:

- pH is stable and near neutral at both wells, but slightly lower at MW-8-3A. pH at MW-8-3A is sometimes slightly below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U.
- Total dissolved solids concentrations at both wells exhibit slightly increasing long-term trends with some variability. Concentrations are comparable in both wells, but tend to be slightly higher and more variable at MW-8-3A. The total dissolved solids concentration at MW-8-3A typically exceeds the Secondary Drinking Water Standard of 500 mg/L, while concentrations at MW-8-3B typically fluctuate around the standard.
- Sulfate concentrations in both wells exhibit relatively stable long-term trends with some variability. Sulfate concentrations at MW-8-3A typically fluctuate around the Secondary Drinking Water Standard of 250 mg/L, while concentrations at MW-8-3B are typically below the standard.
- Arsenic (dissolved) concentrations at both wells exhibit stable/decreasing long-term trends with seasonal variability. Peak concentrations exceed the Primary Drinking Water Standard of 10 µg/L (not since 2011 at MW-8-3B). Dissolved arsenic concentrations at MW-8-3A typically range from 3 to 20 µg/L over the past 10 years. At MW-8-3B, arsenic concentrations exhibit a similar stable/decreasing trend at slightly lower concentrations.

Since 2019, total arsenic at MW-8-3A exhibits increased variability. Talen believes that relatively permeable material is associated with relic stream channels existing beneath Basin 5, potentially accounting for arsenic detections at wells MW-8-3A and MW-8-3B.

- Iron concentrations at MW-8-3A are variable and exceed the Secondary Drinking Water Standard of 0.3 mg/L (possibly due to impacts from historical pyritic material handling). Iron is present in MW-8-3B, but at a much lower concentrations than at MW-8-3A, suggesting possibly more impact in the upper part of the water-bearing zone (and/or possibly a higher iron concentration related to the high turbidity within MW-8-3A groundwater). Peak iron concentrations in MW-8-3B exceed the standard.
- Manganese concentrations in both wells exceed the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L but exhibit long-term stable trends with some variability.
- Molybdenum concentrations in both wells normally exceed the Act 2 residential Statewide Health Standard of 40 µg/L but exhibit long-term stable/slight decreasing trends.

5. MW-8-4 - Key results for this quarter and trends for MW-8-4 are as follows:

- Field pH (5.30 S.U.) remains below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U. The historical pH range for this well is approximately 4.5 to 6.0. Buffering capacity is typically minimal.
- Sulfate and total dissolved solids concentrations are elevated and variable at MW-8-4, and exceed Secondary Drinking Water Standards but exhibit decreasing long-term trends.
- Aluminum concentrations are elevated and variable relative to most other Basin 5 wells, sometimes exceeding the Secondary Drinking Water Standard of 200 µg/L.
- Beryllium, cadmium, nickel, and zinc concentrations are variable and elevated relative to other Basin 5 wells. However, since 2012, concentrations have generally decreased and have been less variable. Nickel concentrations fluctuate around the Act 2 standard, but the other parameters meet respective regulatory standards.
- Chloride concentrations are seasonally variable but remain well below the Secondary Drinking Water Standard of 250 mg/L. Peak chloride concentrations have decreased since 2015.
- Manganese concentrations remain elevated at 10,600 µg/L compared to the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L. Manganese concentrations at MW-8-4 are the most elevated and variable of all the Basin 5 wells, but concentrations exhibit a gradual long-term downward trend with decreasing variability.

6. MW-8-5A and MW-8-5B - These wells are located at the northwestern corner of Basin 5. Key results for this quarter and trends for MW-8-5A and MW-8-5B are as follows:

- pH is stable and near neutral at both wells.

- Total dissolved solids concentrations are elevated in excess of the Secondary Drinking Water Standard in both wells, with increasing trends (current concentrations of 772 and 754 µg/L for MW-8-5A and MW-8-5B, respectively). These increasing TDS trends are likely related to similar increasing trends for calcium, magnesium, and specific conductivity in both wells.
- Sulfate concentrations demonstrate slight increasing/stable long-term trends in MW-8-5A and MW-8-5B with current concentrations of 304 mg/L and 325 mg/L, respectively, compared to the Secondary Drinking Water Standard of 250 mg/L. Sulfate concentrations in these two wells appear to be stabilizing/decreasing since 2015.
- Arsenic (dissolved) concentrations in MW-8-5A and MW-8-5B are elevated (current concentrations of 117 µg/L and 372 µg/L, respectively) in excess of the Primary Drinking Water Standard of 10 µg/L. Arsenic concentrations at MW-8-5B exhibit a long-term stable trend, but concentrations exhibit a short-term increasing trend beginning in late 2020/early 2021. Concentrations at MW-8-5A exhibit a slight decreasing trend.

Note: PPL's groundwater consultant, Ish Inc., confirmed that Basin 5 is the source of arsenic identified in MW-8-5A and MW-8-5B. As part of the assessment conducted to investigate the elevated arsenic in MW 8-5 area, Ish Inc. established that arsenic attenuates quickly and is not elevated in the new point of compliance wells MW-8-10A and MW 8-10B.

- Lithium concentrations exceed the Act 2 residential Statewide Health Standard of 83 µg/L, but demonstrate fairly stable long-term trends at both wells (current concentrations of 195 µg/L and 176 µg/L for MW-8-5A and MW-8-5B, respectively), except for upward fluctuations of total lithium which occurred during the fourth quarter of 2019 and first quarter of 2020.
 - Manganese concentrations exceed the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L in both wells (current concentrations of 429 and 461 µg/L for MW-8-5A and MW-8-5B respectively). Manganese exhibits a stable trend at MW-8-5A and a slight decreasing trend at MW-8-5B.
 - Molybdenum concentrations exceed the Act 2 residential Statewide Health Standard of 40 µg/L in both wells (current concentrations of 366 and 372 µg/L for MW-8-5A and MW-8-5B respectively), but exhibit slightly decreasing long-term concentration trends with increased variability since the third quarter of 2019.
 - Strontium concentrations exhibit increasing trends in both wells. Strontium concentrations are below the Act 2 residential Statewide Health Standard of 4,000 µg/L.
- 7. MW-8-10A, MW-8-10B, and MW-8-10C** - Monitoring wells MW-8-10A, MW-8-10B, and MW-8-10C were added to the monitoring program as part of Area 8 monitoring system located within Basin 5. These wells also serve as the point of compliance wells, downgradient of MW-8-5A and MW-8-5B. MW-8-10A and MW-8-10B are sampled quarterly while MW-8-10C is sampled annually during the second calendar quarter. Most importantly, arsenic concentrations in MW-8-10A, MW-8-10B, and MW-8-10C continue to meet the Primary

Drinking Water Standard of 10 µg/L and exhibit stable/decreasing trends. Other key results and trends for these wells for this quarter are as follows:

- MW-8-10B demonstrates typically slightly alkaline pH and overall better and more stable water quality than MW-8-10A and MW-8-10C. pH at MW-8-10C is also slightly alkaline.
- pH at MW-8-10A is near neutral, but lower than pH at MW-8-10B and MW-8-10C. pH at MW-8-10A is sometimes slightly below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U.
- Sulfate and total dissolved solids concentrations at MW-8-10A are fluctuating around/slightly above Secondary Drinking Water Standards. Sulfate and total dissolved solids concentrations have been stable/decreasing since 2015 with a prominent drop occurring during 2018, and are now only slightly above the respective standards. These trends appear to be related to trends for calcium, magnesium, specific conductivity, and strontium (which have also generally decreased since early 2018 following long-term increasing trends). At MW-8-10B, total dissolved solids concentrations are fairly stable and fluctuate around the 500 mg/L standard. Sulfate concentrations at MW-8-10B are below the 250 mg/L standard, and exhibit a slight decreasing trend.
- Iron concentrations at MW-8-10C are variable and occasionally exceed the Secondary Drinking Water Standard of 0.3 mg/L.
- Manganese concentrations at MW-8-10A are elevated and seasonally variable, exceeding the Secondary Drinking Water Standard of 50 µg/L and sometimes exceeding the Act 2 residential Statewide Health Standard of 300 µg/L. However, peak manganese concentrations at MW-8-10A have decreased significantly since 2018. Manganese concentrations at MW-8-10C also normally exceed the both standards, but are less variable than at MW-8-10A.
- Molybdenum concentrations at MW-8-10C exceed the Act 2 residential Statewide Health Standard of 40 µg/L, while concentrations at MW-8-10A and MW-8-10B sometimes exceed the standard. Similar to manganese, peak molybdenum concentrations at MW-8-10A have decreased significantly since 2018 and haven't exceeded the standard since the first quarter of 2018.
- Vanadium concentrations at MW-8-10B fluctuate around the Act 2 residential Statewide Health Standard of 2.9 µg/L, which was lowered in 2016 along with the analytical limit of quantification.

8. MW-8-12C - Sampling is required at MW-8-12C annually in the second calendar quarter. Key results and trends for the second quarter of 2021 were as follows:

- Iron (dissolved) concentration of 0.49 mg/L exceeded the Secondary Drinking Water Standard of 0.3 mg/L. Iron concentrations have generally decreased with variability since 2016.

- Manganese (dissolved) concentration of 1,730 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and the Act 2 residential Statewide Health Standard of 300 µg/L.
- Molybdenum (dissolved) concentration of 520 µg/L exceeded the Act 2 residential Statewide Health Standard of 40 µg/L. Molybdenum concentrations have fluctuated between approximately 150 and 450 µg/L over the past ten years.
- Several parameters fluctuated downward during the second quarter of 2019 at MW-8-12C including boron, calcium, iron, magnesium, manganese, molybdenum, potassium, specific conductivity, sulfate, total dissolved solids, and total organic carbon. Barium and strontium fluctuated upward. Since the second quarter of 2020, each of these parameters returned to concentrations consistent with respective historical trends.

Pyrite Tomb Monitoring

1. **Pyrite Tomb Standpipe** – The pyrite tomb is monitored at least monthly for water depth and field pH, and quarterly reporting (via this quarterly groundwater report) began in the 2nd quarter of 2017. Talen planned to collect two additional (last) samples from the pyrite tomb standpipe during the 3rd and 4th quarters of 2017 for laboratory analysis (as previously). However, on both quarterly sampling occasions, the standpipe contained too little water to sample (lack of water is a favorable condition). A summary table of the field monitoring results for 2017 thru current is provided in Attachment 2. Trend plots for the field parameters (pH, water depths, water elevations) are provided on the enclosed CD.
2. **MW-PT-1** – Downgradient monitoring well MW-PT-1 was installed in January 2017 to help assess the Pyrite Tomb area. This well is located outside of the Basin 5 berm material in native alluvial sediments. Since monitoring of MW-PT-1 commenced, many parameters have exhibited significant variability with no defined trends yet. Analytical results for the pyrite tomb monitoring well MW-PT-1 are included on Attachment 1, *Summary Table of Basin 5 Groundwater Monitoring Results*, and trend plots for these parameters (as applicable) are provided on the enclosed CD. Key results for this quarter are as follows:
 - pH (5.57 S.U.) was below the Secondary Drinking Water Standard range of 6.5 to 8.5 S.U. Lower pH and alkalinity values at MW-PT-1 appear to correlate with higher groundwater elevations.
 - Total dissolved solids concentration of 643 mg/L exceeded the Secondary Drinking Water Standard of 500 mg/L.
 - Sulfate concentration of 394 mg/L exceeded the Secondary Drinking Water Standard of 250 mg/L.
 - Aluminum (total) concentration of 334 µg/L exceeded the Secondary Drinking Water Standard of 200 µg/L.
 - Lithium (total) concentration of 362 µg/L exceeded the Act 2 residential Statewide Health Standard of 83 µg/L.

- Manganese (total) concentration of 4,030 µg/L exceeded the Secondary Drinking Water Standard of 50 µg/L and Act 2 residential Statewide Health Standard of 300 µg/L.
- Molybdenum (total) concentration of 147 µg/L exceeded the Act 2 residential Statewide Health Standard of 40 µg/L.

Notes:

- Regulatory qualifier codes: M = EPA Primary Drinking Water MCL/TT, S = EPA Secondary Drinking Water MCL, and A = Pennsylvania Act 2 residential Statewide Health Standard for used aquifers.
- MW-19 was sampled for additional parameters (Ga, Ge, Rb, Y) pursuant to Basin No. 7 sampling requirements.
- MW-4-7A, MW-4-10, and MW-19 are additionally sampled for organic parameters during the second and third calendar quarters pursuant to Basin No. 4 South sampling requirements.
- MW-8-10C and MW-8-12C are sampled annually during the second calendar quarter.
- The estimated value for total vanadium at MW-8-10B was 2.91 µg/L.

Result Qualifier Codes

<u>CODE</u>	<u>DESCRIPTION</u>
*	Value exceeds Maximum Contaminant Level
B	Analyte detected in Method, Reagent, or Cal Blank
C	Calculated Value
E	Value above quantitation range
F	Required sample not collected
H	Holding times for preparation or analysis exceeded
I	Instrument failure, not recoverable
J	Analyte detected below quantitation limits
L	Analyzed by contract laboratory
LOD	Limit of Detection (LOD) = Laboratory Detection Limit
LOQ	Limit of Quantitation (LOQ) = Laboratory Reporting Limit
M	Value exceeds Monthly Avg. or MCL
NC	Analyte not certified in NELAC Scope of Accreditation
ND	Not Detected at the Detection Limit
NM	Analyte not measured
O	Result exceeds practical range of determination
P	Sample not preserved properly
Q	QC control standard failure
R	Replicate Recovery outside accepted recovery limits
S	Spike Recovery outside accepted recovery limits
T	Reporting error
V	Sample contamination suspected
X	Other (note required)

Attachment – Statistics Summary

Statistical Analysis

Temporal trends of selected parameters were analyzed using a Theil-Sen estimator, a robust linear regression method. The Theil-Sen estimator is insensitive to outlying spikes in data, making it advantageous over the traditional least squares method of linear regression in identifying significant temporal trends. To comply with proposed RCRA Subtitle D regulations, a nonparametric analysis of variants (ANOVA) of the data is also utilized. The nonparametric ANOVA analysis is a method for comparing medians of two or more groups. In this case, it is utilized to determine if parameter concentrations in downgradient wells are significantly greater than or less than parameter concentrations in the upgradient wells.

An Excel workbook was developed to evaluate historical groundwater monitoring data from Talen sites with the aforementioned statistical tools. This Excel application was used to perform statistical analyses of each site-related groundwater parameter at all monitoring locations for each basin/area of the site. The Excel workbook includes a worksheet containing a summary table of the statistical analyses results for all groundwater parameters and monitoring locations along with other supporting worksheets containing raw data and more detailed statistical information. The most pronounced parameter trends and regulatory exceedances are highlighted on the summary table.

Notes:

1. Upgradient vs downgradient represents the ratio of average concentration in all downgradient wells to average concentration of all upgradient wells (i.e. how many times greater is the concentration in downgradient v
2. Rows are sorted according to "Upgradient vs. Downgradient" ratio. Parameters with higher downgradient concentrations are on top (orange formatting indicates greater downgradient concentrations; blue formatting in
3. Sub-headings for each location are as follows:

Trend (%) :	Percent increase/decrease in concentration of the Theil-Sen trendline over 10-year period (red arrow = increase; blue arrow = decrease; arrow size is proportional to increase/decrease).
p :	p-value of Theil-Sen trend.
$\bar{x}$:	Mean measured concentration over time frame.
$\bar{x}$ (%)	Proportion of $\bar{x}$ to applicable standard (red formatting indicates $\bar{x}$ is 1000% of the standard; orange formatting indicates $\bar{x}$ is 100% of the standard; gradation of orange and red are proportional to
n :	Number of samples over time frame.
ND :	Number of "non-detect" samples over time frame. For concentrations between LOD and LOQ (reported as "< LOQ"), the LOQ is treated as an additional detection limit in the analysis.
J :	Number of samples with estimated concentrations (J-values). Currently concentrations between LOD and LOQ are reported as "< LOQ" instead of estimated values.
> :	Number of exceedances over time frame; date of most recent exceedance.
Max :	Maximum measured concentration over time frame; date of maximum concentration.
p (comparison) :	p-value of two-group comparison analysis (comparison to upgradient wells). Analysis test results based on either: p = parametric (t-test) or n = nonparametric (Wilcoxon test); determined based on number of detections and Shapiro-Wilk (S-W) normality test results. If p-value of normality test for either group is < 0.05 then defaults to nonparametric comparison (Wilcoxon test). If p (comparison) < 0.05 then: < Up means data are statistically less than upgradient data; > Up means data are statistically greater than upgradient data.

4. "NC" refers to not calculated (when there is insufficient data to run statistical analysis).
